## ACKNOWLEDGEMENTS

The authors wish to acknowledge the many people who graciously gave of their time in support of this effort. We are especially grateful to our partners for their collaboration, support, and thoughtful feedback. In particular, we would like to thank Vic Bugni, Kate Cermak, Dr. Delsa Chapman, David Judd, Andy Middlestead, and Dr. Michael Rice from the Michigan Department of Education; Tom Howell, Mike McGroarty, and Lauren Paluta from the Center for Educational Performance and Information; Kyle Kwaiser and Nicole Wagner from the Michigan Education Data Center and the University of Michigan; and Don Dailey from the Michigan Data Hub. At Michigan State University, we thank Jeremy Anderson and Dongming Yu for their invaluable research assistance, Scott Imberman for his thoughtful feedback on parts of our analyses, Emily Mohr for her coordination and support, and Meg Turner for assistance with compiling and formatting the text for the report. Finally, we thank Bridgette Redman for her excellent copy-editing.

## DISCLAIMER

The Education Policy Innovation Collaborative (EPIC) at Michigan State University is an independent, non-partisan research center that operates as the strategic research partner to the Michigan Department of Education (MDE) and the Center for Educational Performance and Information (CEPI). EPIC conducts original research using a variety of methods that include advanced statistical modeling, representative surveys, interviews, and case study approaches. This research used data structured and maintained by the MERI-Michigan Education Data Center (MEDC). MEDC data are modified for analysis purposes using rules governed by MEDC and are not identical to those data collected and maintained by the MDE and/or CEPI. Results, information, and opinions solely represent the author(s) and are not endorsed by, nor reflect the views or positions of, grantors, MDE and CEPI, or any employee thereof.

# Executive Summary

## OVERVIEW & PURPOSE

In order to understand student learning and progress toward educational goals during the pandemic, the Michigan legislature mandated new data collection and reporting requirements for local school districts beginning in the 2020-21 school year ([2020 PA 149](#), [2021 PA 48](#)). The Education Policy Innovation Collaborative (EPIC) prepared this report in collaboration with the Michigan Department of Education (MDE), the Center for Educational Performance and Information (CEPI), the Michigan Data Hub (MDH), and the Michigan Education Data Center (MEDC). It is the second in a series of reports that will be delivered to the governor and the senate and house standing committees responsible for education legislation in the Michigan legislature to provide insight into Michigan students' progress toward learning goals during the COVID-19 pandemic.

The [first report](#), which was released in August 2021, provided a summary of K-8 students' performance in the fall and spring of the 2020-21 school year, as measured by math and reading benchmark assessments. We found that students across the state missed critical opportunities to learn during the 2020-21 school year; regardless of assessment vendor, subject, or grade level, a substantial set of students scored "significantly behind grade level" on both the fall and spring assessments. Further, across all subjects and grades, the rate of learning appeared to be slower than in a typical pre-pandemic school year. The purpose of this second report is to assess how progress toward learning goals during the 2020-21 school year differed across student groups and district types.

## RESEARCH QUESTIONS & STUDY OVERVIEW

To expand on the analyses in our first report and gain a deeper understanding of assessment outcomes for Michigan students in 2020-21, we explore each of the following research questions:

- How did performance on fall and spring benchmark assessments differ across subgroups of students with different demographic and academic characteristics?
- How did assessment performance differ across districts that offered fully in-person, hybrid, or remote instruction all year, as well as those that offered different modalities in the fall than in the spring?

- Did pre-existing achievement gaps between subgroups of students worsen over the course of the school year? Did new achievement gaps emerge?
- How did students' trajectories toward grade-level proficiency on the M-STEP assessment compare to the trajectories of similar students before the pandemic?

In addition to the benchmark assessment results we presented in our first report, we incorporate additional data (detailed in Table I) about student performance on end-of-year state summative assessments, student demographic and academic subgroups, and the mode in which districts provided instruction to students throughout the 2020-21 school year to help us address these questions.

Table I. Data Sources		
Type	Source	Additional Details
<b>Benchmark Assessments (Fall &amp; Spring 2020-21)</b>	NWEA: MAP Growth	Math & Reading (K-8)
	Curriculum Associates: i-Ready	Math & Reading (K-8)
	Renaissance Learning: Star 360	Math (1-8), Reading (K-8), Literacy (K-3)
	DRC: Smarter Balanced ICA	Math & ELA (3-8)
	MDE K-2 Benchmark	Math & Early Literacy (K-2)
<b>Summative Assessments</b>	M-STEP	Math & ELA (3-7) End-of-Year 2017, 2019, 2021
<b>Student Characteristics</b>	MDE/CEPI administrative datasets and district-provided aggregate datasets	Gender, race/ethnicity, economically disadvantaged status, special education status, prior M-STEP performance
<b>District Mode of Instruction</b>	Reconfirmed COVID-19 Learning Plan Monthly Questionnaire	District-reported instructional modality (fully in-person, hybrid, and/or fully remote) for each month of 2020-21

Assessment administration and participation looked very different in 2020-21 than ever before. New policies and legislation gave districts the flexibility to continue delivering instruction and meet student needs during the pandemic. Districts were able to choose which benchmark assessment they would administer and were not required to administer the end-of-year M-STEP to remote students. This means that the data from both types of assessments are somewhat limited, but in different ways. There are fewer districts represented in the benchmark assessment data than in the M-STEP data (629 and 825 districts, respectively). However, within participating districts, test-taking rates were higher for benchmark assessments than for the M-STEP. By considering both data sources, as well as differences in the characteristics of

students represented in each source and the general population of Michigan students, we can start to build a more complete picture of student learning outcomes for the 2020-21 school year.

## KEY FINDINGS

In our [previous report](#), we showed that, on average, students made less than normal progress toward learning goals in 2020-21, as measured and defined by the different assessments included in the study. After examining these patterns across subgroups and data sources, we find that this same pattern generally holds regardless of student and district characteristics, but that there are substantial disparities in the extent to which different subgroups were affected.

### Black, Latino/a/x, and Economically Disadvantaged Students Were More Likely to Start and End the Year “Significantly Behind Grade Level”

As we showed in our first report, 27% of 4<sup>th</sup>-grade students who took the NWEA MAP Growth Math assessment were considered “significantly behind grade level” in the fall, increasing to 33% in the spring. Our subgroup analyses reveal that these percentages were much higher for Black students (49% in the fall and 66% in the spring) and Latino/a/x students (35% in the fall and 43% in the spring) than for White students (21% in the fall and 24% in the spring) and Asian students (9% in the fall and 10% in the spring). These patterns are generally consistent across grade levels, subjects, and assessment providers. We find similar disparities between students who are economically disadvantaged; in NWEA districts, these gaps tend to be largest for the highest-achieving and lowest-achieving students (based on their prior M-STEP proficiency levels from 2019).

### Many Pre-Existing Achievement Gaps Grew Wider over the Course of the School Year

Across nearly all grade levels and subjects, gaps in the percentages of students who are “significantly behind grade level,” as well as gaps in average test scores grew over the course of the school year for Black and Latino/a/x students (compared to White students) and for economically disadvantaged students (compared to students who are not economically disadvantaged). In most cases, test score gaps between special education students and general education students increased as well.

## Students Were Less Likely to Maintain or Improve upon Their M-STEP Math and ELA Proficiency Levels from 2019 to 2021, Compared to Similar Students who Took These Assessments in 2017 and 2019

Of students who previously scored “Not Proficient” in mathematics on the 3<sup>rd</sup> grade M-STEP, only 9% scored in a higher proficiency level as 5<sup>th</sup> graders in 2021 (compared to 18% of students in the “pre-pandemic cohort” who scored “Not Proficient” as 3<sup>rd</sup> graders in 2017 and took the 5<sup>th</sup> grade assessment in 2019). Similarly, students whose 3<sup>rd</sup> grade scores on the 2019 M-STEP were in the “Partially Proficient,” “Proficient,” or “Advanced” levels were less likely than similar students in the pre-pandemic cohort to reach a higher level and more likely to score in a lower level as 5<sup>th</sup> graders in 2021. We find similar patterns across grade levels as well as for ELA, however, the differences between the pandemic and pre-pandemic cohorts are smaller for ELA than they are for mathematics.

## Math and Reading Achievement Growth During the Pandemic Consistently Lagged Pre-Pandemic Growth Rates, Particularly for Female, Black, and Economically Disadvantaged Students

Multiple regression analyses examining yearly individual student growth on the math and ELA M-STEPs from 2019 to 2021 (during the pandemic) relative to pre-pandemic growth from 2017 to 2019 show that students experienced significantly lower achievement growth during the pandemic than in the two years prior. Specifically, mathematics growth among students in the pandemic cohort was roughly two-tenths of a standard deviation behind students in the pre-pandemic cohort, while ELA growth trailed by a bit less than a tenth of a standard deviation. While not large, these effect sizes are quite substantial and suggest that Michigan students made slower gains during the pandemic than in the years prior. These lags in achievement growth were greater for female, Black, and economically disadvantaged students.

## Districts that Offered In-Person Instruction All Year Fared Better than Those that Were Remote

In-person districts typically started and ended the year with higher average test scores than students in districts that were remote all year or switched between remote and hybrid. While average scores increased from fall to spring regardless of a district's mode of instruction, these increases were consistently larger for districts that offered in-person instruction all year than for those that were remote all year or switched

between remote and hybrid. As a result, gaps between the average scores for these groups became wider over the course of the year. Districts that switched between in-person and hybrid or remote modalities generally started the year with slightly higher scores than those that were in-person all year, but these gaps shrunk or in some cases reversed over the course of the year. Results from multiple regression analyses confirm these findings; districts that offered an additional month of remote schooling had nearly a percentage point more students scoring “significantly behind grade level” on math assessments by spring 2021. Similarly, an additional month of in-person schooling was associated with one-half a percentage point fewer students scoring “significantly behind grade level” on reading assessments. Multiple regression analyses confirm these results, suggesting that districts that offered only remote instruction throughout the 2020-21 school year experienced a reduction in math achievement growth that was twice as large as that for in-person districts.

## Unique Challenges with Test Administration and Participation in 2020-21 Resulted in Imperfect and Incomplete Data

Students who participated in either the benchmark or M-STEP assessments were more likely to be White and less likely to be economically disadvantaged or eligible for special education or English learner services, compared to the overall population of Michigan students. These differences are particularly stark in the 2021 M-STEP data. This is partly because most remote students were not tested. Although many remote students did participate in benchmark assessment testing, patterns in the data suggest that some of them (particularly those in younger grade levels) may have had assistance from their caregivers at home while taking the test, making it difficult to discern their true skill level from these assessments.

# Section One:

# Introduction

As the COVID-19 pandemic took hold in March 2020, Michigan's schools—like most others across the country—were forced to close their doors and transition to remote instruction for the remainder of the school year. While many Michigan school districts gave students the option to return to learn in person for the 2020-21 school year, an estimated 47 to 64% of students across the state started the year in a fully remote format. By the end of the school year, 22 to 42% of Michigan K-12 students were still learning remotely (Hopkins, Kilbride, & Strunk, 2021). Whether enrolled remotely or in-person full- or part-time, students experienced challenging learning conditions during the 2020-21 school year. As many across the state and country have noted, this past school year was unprecedented in the level of disruption faced by many, if not most, K-12 students.

There is mounting evidence that students across the country and around the world missed important opportunities to learn during the pandemic. Early estimates of unfinished learning from state and national assessments suggest that students experienced much lower learning gains in 2020-21 relative to previous years. This is particularly the case for students without sufficient access to parent or teacher supports (Kuhfeld, Soland, et al. 2020) and for low-income, Black, and Hispanic or Latino/a/x students (Azevedo et al. 2020; Baisley et al. 2021; Gross & Lake, 2021; Dorn et al. 2020a, b; Kogan & Lavertu, 2021; Kuhfeld & Tarasawa, 2020) and for those learning remotely (Gross & Lake, 2021; Kogan & Lavertu, 2021; Sass & Goldring, 2021).

To understand student learning and progress toward educational goals during the pandemic, the Michigan legislature mandated new data collection and reporting requirements for local school districts during the 2020-21 ([2020 PA 149](#)) and 2021-22 school years ([2021 PA 48](#)). This report is the second in a series that will be given to the Michigan governor and the House and Senate standing committees responsible for education legislation to provide insight into Michigan students' progress toward learning goals for the 2020-21 and 2021-22 school years. The Education Policy Innovation Collaborative (EPIC) at Michigan State University prepared this report in collaboration with the Michigan Department of Education (MDE), the Center for

Educational Performance and Information (CEPI), the Michigan Data Hub (MDH), and the Michigan Education Data Center (MEDC) at the University of Michigan as a summary of the student academic growth across this 2020-21 school year.

## MICHIGAN'S BENCHMARK ASSESSMENT LEGISLATION

On August 20, 2020, Michigan Governor Gretchen Whitmer signed a series of three "Return to Learn" bills intended to provide districts with flexibility to adapt their programs as necessary to safely provide instruction during the pandemic ([2020 PA 147](#), [2020 PA 148](#), [2020 PA 149](#)). For the 2020-21 school year only, the state legislature waived many instructional requirements, including minimum numbers of days and hours and what learning activities count toward the attendance and enrollment calculations used to determine their state aid allocations. Along with this increased flexibility, the "Return to Learn" legislation outlined a new set of requirements for the 2020-21 school year to ensure that districts continued to adequately meet students' needs without the same instructional requirements in place.

As a condition for receiving state aid for the year, the legislation required each district to develop an extended COVID-19 learning plan describing how it would deliver instruction and establishing educational goals for the 2020-21 school year. These educational goals were to include increased student achievement or growth as measured using one or more benchmark assessments, overall and for all subgroups of students. Districts were required to assure that they would select and administer appropriate benchmark assessments to all K-8 students at the beginning and end of the school year to determine whether students made meaningful progress toward mastery of state standards in reading and mathematics.

The "Return to Learn" legislation provided districts the option to choose one of four state-approved benchmark assessments or one or more benchmark assessments that contain progress monitoring and enhanced diagnostics in reading and/or progress monitoring in mathematics. Alternately or in addition, districts were allowed to choose a locally developed benchmark assessment that meets the same requirements. While the legislation prohibited the use of these data for accountability purposes, districts that elected to use an approved provider's benchmark assessment were required to compile and report their results through the MDH network for use in a statewide aggregate report for the governor and the House and Senate standing committees responsible for education legislation in the Michigan legislature.

To continue tracking academic progress, the Michigan legislature again passed legislation in summer 2021 that required districts to administer benchmark assessments throughout the 2021-22 school year ([2021 PA 48](#)). The new legislation provided districts with the same flexibility to choose one of four state-approved benchmark assessments, a local benchmark assessment, or one or more benchmark assessments that contain progress monitoring and enhanced diagnostics in reading and/or progress monitoring in mathematics. Similar to requirements for the 2020-21 school year, benchmark assessments must be administered to all K-8 students in both fall 2021 and spring 2022.

## PURPOSE OF THIS REPORT

MDE, CEPI, and MDH have worked with two university research partners—EPIC at Michigan State University and MEDC at the University of Michigan—for more than a year to compile the benchmark assessment data districts provided under the “Return to Learn” legislation and prepare for a second round of data collection during the 2021-22 school year. The first legislatively mandated report in this series, which was released in August 2021, found that students across the state missed critical opportunities to learn during the 2020-21 school year; regardless of assessment vendor, subject, or grade level, a substantial set of students scored “significantly behind grade level” on both the fall and spring assessments. Further, across all subjects and grades, Michigan students did not make normal progress towards learning goals as measured and defined by all four approved assessment vendors. While learning as measured by the benchmark assessments did occur over the 2020-21 school year, the rate of learning appeared to be slower than in a typical pre-pandemic school year.

The primary purpose of this second report, which will be delivered to the governor and the House and Senate standing committees responsible for education legislation (see Sections 104.12 and 104.16 of MCL 388.1704 as amended by [2020 PA 149](#) and [2021 PA 48](#)), is to assess how progress toward learning goals during the 2020-21 school year differed across student groups and district types (including by instructional modality offered). Specifically, this analysis will use benchmark assessment data as well as data from the Michigan Student Test of Educational Progress (M-STEP) to examine differences in performance on benchmark assessments across student subgroups (i.e., race/ethnicity, gender, economically disadvantaged and disability status, and 2019 M-STEP proficiency levels) and across districts using various instructional modalities for all or a subset of the 2020-21 school year (i.e., districts that offered the same instructional modality during both the fall and spring benchmark administration periods—in-person, hybrid, or remote—and districts that switched modalities between administrations).

In the remainder of this report, we first discuss the data and methods we use. Section Three provides results from our analyses and Section Four describes the content of future reports in this series. We conclude with a brief discussion of the implications of our findings for Michigan K-12 education as we progress through the 2021-22 school year.

# Section Two:

## Data and Methods

Each year, millions of K-12 students across the country participate in benchmark assessments and summative end-of-year standardized achievement tests. Benchmark assessments are designed to help educators and administrators track students' progress toward grade-level standards and learning goals, and to provide feedback to help drive future instruction. Summative standardized achievement tests are intended to provide policymakers, stakeholders, and educators with an understanding of student, school, district, and state performance on state-set standards, both as an end-of-year snapshot and for year-over-year growth.

Under Michigan's benchmark assessment legislation, districts must administer either a benchmark assessment from the MDE-approved provider list, an assessment that provides adequate progress monitoring, or a local benchmark assessment to all K-8 students at the beginning and end of both the 2020-21 and 2021-22 school years. Districts that choose an assessment from one of the four approved providers are required to provide aggregate data regarding the results of these assessments through the MDH. The MDH is designed to collect student-level data, and districts were encouraged to submit student-level data rather than aggregating the data themselves. Doing so allows MEDC and EPIC to complete all necessary aggregations in a consistent manner across districts, while still ensuring that state agencies only maintain access to aggregate data, as stipulated in Michigan's benchmark assessment legislation ([2020 PA 149](#) and [2021 PA 48](#)).

In the 2019-20 school year, the United States Department of Education (ED) waived every state in the country from meeting the federal standardized testing requirement outlined in the *Every Student Succeeds Act* for spring 2020 (ESSA, 2015). The ED, however, did not grant similar waivers for the 2020-21 school year and M-STEP testing resumed in spring 2021 after more than a year of disrupted pandemic learning. For the spring 2021 administration of the M-STEP, local school districts were required to offer the assessments in-person, and students who were learning remotely were not required to come into a building to take the test. Many districts effectively chose to

make the M-STEP test optional for students. Overall, roughly 70% of all Michigan students participated in M-STEP testing during the spring 2021 semester.

In this section, we describe the indicators of academic performance from the benchmark and M-STEP assessment data we will use in this report, identify and compare the Michigan school districts that offered each MDE-approved assessment and those that chose to offer their own assessment, and discuss implications of assessment choice and method of providing the data for the population examined in this report. For a full description of the unique characteristics of each MDE-approved benchmark assessment, please see the [first report in this series](#) which was released in August 2021.

## INDICATORS OF ACADEMIC PERFORMANCE ON BENCHMARK ASSESSMENTS

Below, we provide details about the benchmark assessment data that districts submitted to the MDH, regardless of whether they were ultimately included or excluded from the final analytic sample and explain how those data help measure academic performance.

### Definitions of “Significantly Behind Grade Level”

The “Return to Learn” legislation required MDE to identify the number and percentage of students in the state who were “significantly behind grade level” based on their fall and spring benchmark assessment scores from the 2020-21 school year. To provide additional context to the statewide estimates we presented in our first report, this report examines differences in the number and percent of students scoring “significantly behind grade level” across several student subgroups as well as changes in the gaps between subgroups from fall to spring during the 2020-21 school year.

As it would not have been possible to conduct formal standard-setting processes to determine “significantly behind grade level” cut-scores for every assessment provider, grade level, and subject area included in the analysis, MDE and EPIC consulted with each of the assessment providers about the existing metrics, cut scores, and performance levels already established for each assessment. We asked each provider to recommend one of their existing performance standards as the most appropriate proxy for identifying students who are “significantly behind grade level” based on their own expertise with their own assessment. The recommended definitions have substantively different meanings and interpretations across different assessments. For this reason, we analyze data from each provider separately and do not assume

that students who are classified as “significantly behind grade level” using one assessment would receive the same classification using a different assessment.

Table 2.1 provides a summary of the recommended definitions of “significantly behind grade level” for each assessment (detailed descriptions of each definition are available in our first report). In addition, the specific scale score or percentile rank cut scores used to identify students who are “significantly behind grade level” for each assessment provider, subject, and grade level can be found in Appendix Table A.1.

There are a few fundamental differences between these definitions that underscore the importance of analyzing and interpreting the performance data for each assessment separately. For instance, the performance standards for the K-1 NWEA MAP Growth and Renaissance Learning Star 360 assessments are *norm-referenced*, meaning that they are based on how students performed in relation to other students from across the U.S. before the pandemic. The recommended thresholds for NWEA MAP Growth (2<sup>nd</sup>-8<sup>th</sup> grade), Curriculum Associates i-Ready, DRC Smarter Balanced ICA, and the K-2 Early Literacy and Mathematics Benchmark Assessments, on the other hand, are *criterion-referenced*, meaning that they are based on how the content knowledge or skill level that a student demonstrates on the assessment compares to standards regarding what students in a particular grade level are expected to know or be able to do.

In addition, the performance standards for NWEA MAP Growth are based on predictions of students' *future* performance on the M-STEP. Thus, for the NWEA MAP Growth assessments, projections based on fall benchmark assessment scores consider the fact that students had not yet received most of their instruction for the year. Therefore, M-STEP projections based on the NWEA MAP Growth scores indicate whether students are *on-track* to reach a particular performance criterion by the end of the year, not necessarily whether they already reached the criterion at the time they were tested. In contrast, the standards for the other assessments are based on students' *current* performance at the time they are tested. These scores reflect what students know at a given point in time when tested, not what they are projected to know by the end of the school year. Moreover, the “significantly behind grade level” definitions for NWEA MAP Growth (2<sup>nd</sup>-8<sup>th</sup> grade) and MDE's K-2 Early Literacy and Mathematics Assessments are the only ones that are specific to Michigan, as opposed to thresholds that are used across states.

Table 2.1. Summary of “Significantly Behind Grade Level” Definitions by Assessment Provider and Grade Level					
Assessment	Grade Range	“Significantly Behind Grade Level” Interpretation	Norm or criterion-referenced	Status when tested or future projection	National or Michigan standard
NWEA <b>MAP Growth</b>	K-1	At-risk of learning difficulties and in need of intervention	Norm (30th percentile)	Future	National
	2-8	Projected end-of-year M-STEP score in the “Not Proficient” category	Criterion	Future	Michigan
Curriculum Associates <b>i-Ready</b>	K-1	Performing at the “emerging kindergarten” level	Criterion	When tested	National
	2-8	Performing two or more grade levels behind current grade	Criterion	When tested	National
Renaissance Learning <b>Star 360</b>	K-8	Performing below grade-level expectations, in need of intervention	Norm (24th percentile)	When tested	National
MDE <b>K-2s &amp; DRC ICAs</b>	K-2	Significantly behind grade level	Criterion	When tested	Michigan
	3-8	Did not meet standard	Criterion	When tested	National

Notes: NWEA recommended that we use the MAP Growth score thresholds from their Michigan-specific linking study (NWEA, 2020). Curriculum Associates recommended that we use the score ranges from their grade placement tables (Curriculum Associates, 2018). Renaissance Learning’s recommendation was to use their existing benchmark for students who are performing below grade-level expectations, based on their percentile ranks relative to the norming sample for the appropriate grade level and subject area (Renaissance Learning, 2021a, b). DRC recommended that we use the lowest of the four achievement level categories established for the Smarter Balanced ICA assessments as a proxy for “significantly behind grade level” for 3<sup>rd</sup>-8<sup>th</sup> grade (DRC, 2021).

Due to these differences, the data from each provider address slightly different questions about how Michigan students performed this year. The NWEA's MAP Growth assessment for 2<sup>nd</sup>-8<sup>th</sup> grade answer the questions, *"At the beginning of the school year, how many students were not on-track to score above the "Not proficient" category on the end-of-year M-STEP?"* and *"Did their learning trajectories change from fall to spring?"* Results from the Curriculum Associates i-Ready and Smarter Balanced ICA assessments, on the other hand, address questions such as, *"Are students demonstrating the knowledge and skills that are expected for their grade level?"* and *"Did students who were behind in the fall make progress toward grade-level standards over the course of the year?"* The Star 360 assessments and the K-1 MAP Growth assessments provide additional context, with insight into how Michigan students' performance in 2020-21 compares to how students across the country performed before the pandemic.

## Average Scale Scores

We also examine average scale scores among subgroups of students, gaps in average scores between subgroups, and changes in these gaps over the course of the 2020-21 school year. Each benchmark assessment has its own unique scale and scale scores are not comparable across assessments. For example, NWEA's MAP Growth scores range between 100 and 350, while Curriculum Associates' i-Ready scores range between 0 and 800. Therefore, similar to the "significantly behind grade level" measures, we analyze changes in average scale scores and gaps between subgroups separately for each provider. However, because the MAP Growth, i-Ready, Star 360, and ICA benchmark assessments are all scored on vertical scales that are consistent across all grade levels, we are able to compare scores from the same assessment over time.

Overall, across all subgroups, grades, and assessment providers, we would expect to see an increase in average scale scores throughout the school year as students receive more instruction and progress academically. As the results will show, this is indeed true for nearly all student subgroups. When discussing the results that follow, rather than focusing on these common increases, we will instead highlight the few instances where specific subgroups of students saw decreases in average scale scores between the fall and spring semesters.

## Subgroup Comparisons

Although we can compare average scale scores or percentages of students who are "significantly behind grade level" across student groups and grades, it is important to note that expectations for "typical growth" over the course of a school year often differ by grade level, subject, and fall achievement levels. For example, 3<sup>rd</sup>-grade students

who were considered “on or above grade level” on the i-Ready Reading assessment at the beginning of the year typically score about 17 scale score points higher in the spring than they did in the fall, whereas 8<sup>th</sup>-grade students who were “on or above grade level” in the fall only score about 4 scale score points higher in the spring. Third graders who were considered “two grade levels below” based on their fall i-Ready Reading scores, on the other hand, typically score about 33 points higher in the spring than they did in the fall, compared to a 12-point increase for 8<sup>th</sup>-grade students who were “two grade levels below” in the fall (e.g., see Curriculum Associates, n.d.; Renaissance Learning, 2021b-d; Thum & Kuhfeld, 2020). We therefore discourage comparisons of fall-to-spring changes in average scale scores or percentages of students who are “significantly behind grade level” across student subgroups with different fall performance levels, across grade levels, or across subject areas. Rather, we examine performance gaps between subgroups in the fall and spring, as well as changes in these gaps over the course of the year. In other words, **we focus on whether the gap between two subgroups widened or narrowed from fall to spring, and not on whether one subgroup “grew” more than another.**

In addition to our comparisons of average scale scores or percentages of students who are “significantly behind grade level” across student demographics, we also compare outcomes across multiple measures of district-level instructional modality decisions throughout the 2020-21 school year. Specifically, we compare benchmark outcomes across districts that offered only in-person, hybrid, or remote instruction during both the fall and spring benchmark administration periods<sup>1</sup> (i.e., “In-Person All Year,” “Hybrid All Year,” and “Remote All Year,” respectively), districts that offered in-person instruction during one administration period and hybrid or remote instruction during the other period (i.e., “In-Person Part-Year”), and districts that offered hybrid instruction during one administration period and remote instruction during the other period (i.e., “Hybrid Part-Year”).

It is important to note that district-level instructional modality decisions changed throughout the school year. These changes highlight potential differences in testing environments for some students between the fall and spring assessment periods which may lead to inflated fall scale scores among students who were tested remotely and had access to additional resources (e.g., parental help). While we do not have the ability to identify which students completed benchmark assessments at home or in the classroom, NWEA, Curriculum Associates, and Renaissance Learning collected data on students’ testing location for at least a portion of the 2020-21 school year and have reported national findings related to modality of assessment. Renaissance Learning determined that, nationally, about 20% of Star tests from the spring 2021 testing period were completed remotely. NWEA and Curriculum Associates were able to use the information collected regarding testing location to identify an “at-home

advantage” for some early grade-level students. For example, Curriculum Associates estimated that a significantly smaller share of 2<sup>nd</sup> graders tested outside of school performed two or more grade levels below their peers in fall 2020 compared to historical trends. Similarly, NWEA found that achievement trends between fall 2019 and fall 2020 looked very different between remote and in-person testers; students who tested remotely in the 1<sup>st</sup> and 2<sup>nd</sup> grade in fall 2020 showed large increases in their percentile ranks compared to the previous fall, while students tested in-person showed patterns more consistent with students in higher grade levels (Huff, 2020; Kuhfeld, Lewis, et al. 2020; Renaissance Learning, 2021a).

## Subgroup Comparisons Using M-STEP Data

Finally, since Michigan resumed M-STEP testing in spring 2021, we are now able to compare student achievement trends on the state’s summative assessment before and during the COVID-19 pandemic. To do so, we first calculate the distribution of students across M-STEP proficiency levels for those Michigan students who completed either the M-STEP Mathematics or ELA assessment in both 2017 and 2019 (e.g., students who completed the 3<sup>rd</sup>-grade M-STEP Mathematics in 2017 and 5<sup>th</sup>-grade M-STEP Mathematics in 2019). We repeat this calculation for a second cohort of students who completed M-STEP assessments for the same grade-levels and subject in 2019 and 2021 (e.g., students who completed the 3<sup>rd</sup>-grade M-STEP Mathematics in 2019 and 5<sup>th</sup>-grade M-STEP Mathematics in 2021). By comparing these distributions, we can see how achievement trends differ across students who completed both assessments before the pandemic and those who were potentially affected by school building closures and other pandemic-related interruptions to schooling over the past two school years. This analysis is repeated for students who initially completed 3<sup>rd</sup>-, 4<sup>th</sup>-, or 5<sup>th</sup>-grade M-STEP assessments in 2017 (or 2019), and we also provide breakdowns for each of the student subgroups examined in the main analysis.

## Regression Analysis of Benchmark and M-STEP Data

In addition to descriptive comparisons of scale scores, percentages of students who scored “significantly behind grade level,” and M-STEP scores across subgroups, we use multiple regression models to estimate relationships between these same outcome measures and characteristics of Michigan school districts (including the mode in which they provided instruction throughout the 2020-21 school year) or their students. Multiple regression is a statistical technique used to predict an outcome variable using two or more explanatory variables. This technique allows us to estimate the unique relationship between an explanatory variable (e.g., the percentage of students in a district with a specific demographic characteristic or student-level indicators for gender, race/ethnicity, and economically disadvantaged status) and the outcome

variable, when all else is equal between two districts. For each explanatory variable in the model, we estimate a regression coefficient, which tells us how the outcome variable is expected to change if the explanatory variable were to increase by one unit. For example, in a model where scale scores are the outcome variable, a regression coefficient of -0.5 for the number of months that a district offered fully remote instruction indicates that every additional month of remote instruction is associated with a 0.5-point decrease in average scale scores. Coefficients for explanatory variables that are binary indicators are interpreted as the difference between groups that do and do not have a particular characteristic. For instance, in models where we use M-STEP scores as outcomes, we include data from a “pre-pandemic” cohort of students to allow us to compare trends for students before and during the pandemic. We include a binary indicator set equal to 1 for the “pandemic cohort” and 0 for the “pre-pandemic cohort.” A coefficient of -5.5 for this pandemic cohort indicator would indicate that, on average, students in the pandemic cohort scored 5.5 points lower than students in the pre-pandemic cohort.

## DATA AGGREGATION AND ANALYSIS

Before aggregating the student-level benchmark assessment data provided through the MDH, we restricted the sample to exclude: 1) districts that were not required to report data under Michigan’s benchmark assessment legislation (i.e., districts that did not use products from an MDE-approved assessment provider and districts with open dates after the official fall student count date); 2) students who are not in grades K-8; 3) results from assessments in subject areas other than math and ELA; and 4) results from assessments that are not normed for the grade level of the assessed student (i.e., Star Early Literacy assessments taken by students above grade 3 and Star 360 Math assessments taken by students in kindergarten). Additionally, to ensure that comparisons of assessment results from the fall 2020 and spring 2021 semesters reflect changes in student performance as opposed to changes in the populations of students tested, we further restricted the sample to students who participated in comparable benchmark assessments in the same district in both the fall and spring.

We merged benchmark assessment outcomes for the remaining students with data from the Michigan Student Data System (MSDS) fall 2020 General Collection, the 2019 administration of the M-STEP, and district-level 2020-21 instructional modality data for the purpose of identifying student subgroups. The MSDS data include student demographics (race/ethnicity, gender, and economically disadvantaged status) and information about program eligibility and participation (English learner, special education, homeless, military connected, migrant, and foster status). If the students are missing demographic data in the MSDS that identifies whether they are in a

particular subgroup, they are excluded from breakdowns for that subgroup. M-STEP data include prior ELA and math proficiency levels for 5<sup>th</sup>-8<sup>th</sup> grade students who participated in these assessments in 2019. MDE and CEPI, in partnership with EPIC, collected instructional modality data during the 2020-21 school year under Michigan's "Return to Learn" legislation. This legislation required districts to respond to the Reconfirmed COVID-19 Learning Plan Monthly Questionnaire between September 2020 and May 2021 and describe the modality through which they planned to deliver instruction each month (e.g., in-person, hybrid, or remote). Finally, we constructed binary indicators to identify students as "significantly behind grade level" in each subject and time period based on the definition and cut scores each assessment provider recommended.

To construct the aggregate data file used for the analysis, we calculated the counts of non-missing values, sums, and averages of these "significantly behind grade level" indicators across all students in the same subgroup, district, and grade level who completed an assessment from the same provider. The resulting data file provides the total number of students tested, total number of students classified as "significantly behind grade level," and percent of tested students classified as "significantly behind grade level." At the same time, we calculated the average and standard deviation of scale scores across all students in the same subgroup, district, and grade level who completed an assessment from the same provider. We then combined the resulting district-level aggregate dataset with data from individual districts that prepared their own aggregate data files in a compatible format in lieu of submitting student level data through the MDH. The results we present in this report are further aggregated to the state level. To prevent identification of any individual students from very small subgroups, we suppress results for any cells that represent fewer than ten students.

## Analytic Sample

Under Michigan's benchmark assessment legislation, school districts serving K-8 students throughout the school year are expected to submit benchmark assessment data in some form. For this analysis, CEPI identified districts of interest as those with open dates before the official fall student count date for the fall 2020 semester (October 7<sup>th</sup>, 2020), that remained open as of June 1<sup>st</sup>, 2021, and that served students in at least one grade level within the K-8 range. The analysis that follows represents 629 of the 848 Michigan school districts that meet all these criteria. The remaining 219 districts could not be included for reasons described in the earlier report (see Section 3, pages 18-19) and are summarized in Table 2.2. The included districts teach 79% of the population of K-8 students in Michigan.

We are able to include only a subset of students enrolled in these 629 districts in our analysis. To ensure that our analysis captures changes in students' performance from fall to spring rather than changes in test participation rates, students are only included in the analysis if they were tested in both the fall and the spring using an assessment from the same provider for the same content area and grade level. In total, 58,386 students could not be included because their districts only provided data from one assessment (fall or spring) for them. Because the legislation requires us to conduct the analysis using district-level aggregate data rather than student-level data, we further restricted the analytic sample to students whose fall and spring tests were administered by the same district. This ensures that differences between aggregate measures from the fall and spring represent changes in performance across a consistent set of students, and do not capture changes in average performance due to student mobility between districts. We omitted from the analysis 3,367 students who were tested in different districts in the fall and spring.

Table 2.2. Michigan K-8 District and Student Coverage by Analytic Sample Exclusion				
Exclusions	N Districts	% Districts	N Students	% Students
<b>All Districts</b>	848	100.0	967,066	100.0

<b>Analytic Sample</b>	629	74.2	590,819	61.1

*Notes: Districts are classified based on the data submitted to MDH and provided to EPIC by 3 p.m. on August 16<sup>th</sup>, 2021. Sources: Benchmark assessment data submitted by districts directly to the Michigan Data Hub, survey responses from districts that chose to use local benchmark assessments (submitted through GEMS/MARS), summary data from MDH regarding which districts provided authorization for EPIC to access their benchmark assessment data, and district responses to an initial survey from MDH about the assessments they intended to use and data they intended to report to fulfill requirements of the "Return to Learn" legislation.*

After completing the exclusions listed above, we include 629 total districts and 590,819 students (61% of all Michigan K-8 students) in the final analytic sample for this report.

This group of districts includes 519 using NWEA's MAP Growth, 45 using Curriculum Associates' i-Ready assessments, 64 using Renaissance Learning's Star 360 assessments, and 23 using DRC's ICA and MDE's K-2s. Twenty-two districts administered assessments from two different providers. The exact student count for each subgroup analysis varies because students with incomplete demographic information in the MSDS are excluded from breakdowns if they are missing data for the specific demographic characteristic being examined.

To understand how students in benchmark districts compare to the full population of Michigan K-8 students, Tables 3.2 through 3.5 in our first report present average characteristics for four different groups of students: the full population of Michigan K-8 students, all K-8 students in a benchmark assessment district, all K-8 students in a benchmark assessment district that participated in testing, and all students included in either the mathematics or reading/ELA analytic samples. Student characteristics for all four groups are reported separately by assessment provider.

As discussed in our first report, the districts using NWEA's MAP Growth assessments are largely representative of the state, however, the students within those districts with comparable benchmark assessment data from the fall and spring were less likely to be economically disadvantaged, Black, or receiving special education services (an IEP or a 504 plan) than those who did not have comparable assessment data. Districts using the other three assessment providers, on the other hand, are quite different, in terms of student composition, from the state as a whole. Districts that used the i-Ready assessments represent a larger share of Black students, while Star 360 and Smarter Balanced ICA districts tend to have far more White students and fewer economically disadvantaged students. These differences are particularly important to keep in mind when comparing results from one provider to historical data for the state of Michigan or a nationally representative sample.

Research exploring trends in academic achievement over the past two years makes clear that the effects of the COVID-19 pandemic on students varied across student populations and the pandemic has had a greater and more negative effect on the achievement and achievement growth of economically disadvantaged, Black, and Hispanic or Latino/a/x students, as well as English learners (e.g., Amplify Education, 2021; Dorn et al., 2020a, b; Kogan & Lavertu, 2021; Pier et al., 2021; Sass & Goldring, 2021). Given that these specific student populations are underrepresented in the analytic samples for some of the benchmark assessment providers, it is likely that our results overstate any academic growth observed throughout the 2020-21 school year. Similarly, given that the students who took the M-STEP in spring 2021 were unrepresentative of the overall population of students in Michigan in many of the same ways as the benchmark assessment sample (see [EPIC, 2021](#)), our analysis of

growth on the M-STEP between 2019 and 2021 may overestimate student performance across the state and within subgroups.

## Testing Rates by Student Subgroup

Table 2.3.1 through Table 2.3.5 present grade-subgroup-specific enrollment counts and benchmark testing participation rates by race/ethnicity and gender, economically disadvantaged and special education status, as well as 2019 M-STEP proficiency levels. Enrollment counts and participation rates for each student subgroup and grade level are reported separately by assessment provider. Note, the denominator in each testing rate is based on grade-specific aggregate enrollment counts across all districts offering a particular benchmark assessment for that grade level (e.g., a district can be a MAP Growth district for some grade levels but not for others if the district chose to offer different benchmark assessments for different grade levels). Additionally, grade-specific enrollment counts and participation rates for each student subgroup were relatively consistent across our reading and mathematics samples, therefore, figures for the reading sample are presented below and the remaining results can be found in Appendix Tables A.2 through A.16. Finally, for each of the testing rate tables provided below, as well as all the results tables that follow in the next section and the Appendix, we suppress outcomes for any student subgroup-grade combination in which less than 10 students participated in benchmark testing.

As seen in Table 2.3.1, testing rates varied by race/ethnicity, grade, and assessment provider. Averaging across grade levels, between 83 and 89% of each racial/ethnic subgroup in MAP Growth districts participated in benchmark testing, with the highest rates among White and Asian students. These averages, however, mask certain patterns that are unique to specific subgroups and grade levels. For instance, Black kindergarteners have higher testing rates compared to White kindergarteners across all vendors with enrollment counts large enough to report. Similarly, 8<sup>th</sup>-grade Asian students in districts offering i-Ready or Star 360 assessments exhibited testing rates that are well below both the average testing rate for that subgroup as well as 8<sup>th</sup> graders from other racial/ethnic subgroups. In general, participation rates for all racial/ethnic subgroups in MAP Growth districts were higher in early grade levels, especially among Black students, while testing rates in middle school grade levels were slightly lower. Compared to MAP Growth districts, testing rates were lower among students in i-Ready, Star 360, and ICA/K-2 districts, however, the early- and late-grade level trends observed in MAP Growth districts also hold for districts offering a benchmark assessment from one of the other three providers.

	Male	30,541	84.1	6,267	72.8	4,132	71.5	366	82.0
8th	Female	29,987	83.6	6,190	76.6	4,121	68.9	352	75.9
	Male	31,943	82.2	6,492	74.1	4,298	68.2	370	71.9

Notes: The “Enrolled” columns represent the total number of male or female students in each grade level who were enrolled in districts that offered a particular benchmark assessment. The “% Tested” columns represent the percentage of students from each subgroup-grade-assessment provider combination with valid reading/ELA benchmark assessment scores and included in the reading/ELA analytic sample. Source: Male and female students were identified using student demographic data in the MSDS. Enrollment data is from CEPI’s, Student Count Report.

As Table 2.3.2 shows, testing rates do not differ substantially by gender. However, discrepancies in testing rates by economically disadvantaged and special education status were more pronounced (Table 2.3.3 and Table 2.3.4). Across nearly all grade levels and assessment providers, testing participation rates among students identified as economically disadvantaged or eligible for special education services were all lower compared to their respective counterparts. Overall, for all grade levels and assessment providers, approximately 80 to 94% of more advantaged students participated in benchmark testing compared to only 70 to 82% of economically disadvantaged students. Seventy-seven to 90% of general education students participated in testing relative to 66 to 73% of special education students. Since districts were not required to use the same benchmark assessment for all students (e.g., some districts used different benchmark assessments for different grade levels), it is possible that participation rates among special education students are low because district used other specialized, locally developed, or otherwise more appropriate benchmark assessments for special education students.

Notes: “Gen. Ed.” and “Spec. Ed.” represents general and special education students, respectively. The “Enrolled” columns represent the total number general and special education students in each grade level who were enrolled in districts that offered a particular benchmark assessment. The “% Tested” columns represent the percentage of students from each subgroup-grade-assessment provider combination with valid reading benchmark assessment scores and included in the reading/ELA analytic sample. Source: Special education students were identified using student demographic data in the MSDS. Enrollment data is from CEPI’s, Student Count Report.

Table 2.3.5 shows testing rates by grade and 2019 M-STEP proficiency level. As seen in the table, within grade level, testing participation rates for MAP Growth and ICA/K-2 districts typically increased with each M-STEP proficiency level. For example, among 5<sup>th</sup> graders in MAP Growth districts, 88% of students who scored “Not Proficient” on the 2019 M-STEP ELA assessment participated in benchmark testing in both semesters of the 2020-21 school year. At the same time, almost 94% of 5<sup>th</sup> graders who scored “Advanced” on the 2019 M-STEP ELA assessment participated in benchmark testing. Participation rates for students in i-Ready and Star 360 district were less consistent across grade levels and M-STEP proficiency levels. For students in these districts, benchmark participation rates were often highest among students who scored “Not Proficient” on the 2019 M-STEP assessment. For some grade levels, however, benchmark participation rates in i-Ready and Star 360 districts mirror the trends seen in MAP Growth and ICA/K-2 districts.

**Table 2.3.5. Percent of Enrolled Students Included in Reading Analytic Sample by 2019 M-STEP Proficiency, Grade, and Assessment Provider**

Grade	Subgroup	MAP Growth		i-Ready		Star 360		ICA/K-2	
		Enrolled	% Tested	Enrolled	% Tested	Enrolled	% Tested	Enrolled	% Tested
5th	Not Proficient	14,973	88.4	4,791	91.3	1,526	82.7	71	87.3
	Partially Proficient	12,825	91.3	2,740	88.5	1,744	82.7	126	88.9
	Proficient	11,774	92.5	2,377	87.2	1,746	85.5	142	89.4
	Advanced	11,667	93.7	2,464	90.5	1,799	85.9	205	90.2
6th	Not Proficient	17,553	83.4	4,734	81.9	1,893	74.5	100	89.0
	Partially Proficient	11,327	87.4	2,059	80.5	1,442	76.8	159	93.1
	Proficient	11,820	89.1	2,079	82.8	1,584	78.3	187	91.4
	Advanced	13,166	92.1	2,429	84.6	1,839	79.9	184	94.0
7th	Not Proficient	17,763	80.0	4,287	76.8	2,017	73.6	134	83.6
	Partially Proficient	12,222	85.4	2,204	72.5	1,641	71.8	153	83.0
	Proficient	15,903	88.9	2,855	75.7	2,391	72.3	215	82.3
	Advanced	9,905	92.1	1,758	73.2	1,450	72.2	158	86.7
8th	Not Proficient	17,786	77.3	4,283	79.4	2,065	68.8	152	76.3
	Partially Proficient	15,540	85.0	2,830	76.7	2,123	72.2	185	75.7
	Proficient	16,485	88.1	2,926	75.2	2,589	68.3	238	73.5
	Advanced	7,962	90.0	1,480	74.1	1,138	69.5	116	77.6

Notes: "Not Proficient," "Partially Proficient," "Proficient," and "Advanced" represent the four proficiency levels from Michigan's summative M-STEP assessment. The "Enrolled" columns represent the total number students in each grade level who scored in a particular proficiency level on the 2019 M-STEP ELA assessment and were enrolled in districts that offered a particular benchmark assessment. The "% Tested" columns represent the percentage of students from each subgroup-grade-assessment provider combination with valid reading benchmark assessment scores and included in the reading/ELA analytic sample. Source: M-STEP data is provided by MDE. Enrollment data is from CEPI's, Student Count Report.

Finally, Table 2.3.6 shows testing rates for the pre-pandemic and pandemic cohorts used to compare M-STEP Mathematics and ELA outcomes across student subgroups. For each percentage in this table, the numerator counts the number of students from a cohort with valid M-STEP proficiency data in mathematics or ELA for each grade and year (e.g., students who were in 3<sup>rd</sup> grade in 2017 and 5<sup>th</sup> grade in 2019, for the pre-pandemic cohort), while the denominator counts the total number of students from a cohort enrolled in both grades and years (i.e., students who did not progress exactly two grade levels over this period because they skipped or repeated a grade level are not counted as part of the cohort). As seen in the table, testing rates across cohorts are considerably different. Overall, more than 95% of students across all grade levels in the pre-pandemic cohort participated in the M-STEP (and received valid scores) in both 2017 and 2019. These rates did not vary substantially across subgroups, except for special education students, some of whom take Michigan's alternative state

assessment (MI-Access) instead of the M-STEP. In contrast, only 67 to 71% of students in the pandemic cohort had valid M-STEP outcomes in both 2019 and 2021. These differences are expected since local school districts were only able to administer the 2021 M-STEP assessments in-person, and students who were learning remotely were not required to come into a building to take the test.<sup>3</sup> Notably, disparities in M-STEP testing rates across certain subgroups were far more pronounced than disparities for the same groups in the benchmark assessment data. Specifically, 75 to 80% of White students in the pandemic cohort participated in M-STEP testing both years, compared to only 42 to 45% of Black students. Additionally, disparities in M-STEP participation rates between economically disadvantaged students (58 to 65%) and students who were not economically disadvantaged (76 to 80%) were also larger than the discrepancies in benchmark participation for these groups.

Table 2.3.6. Percent of Students with Valid M-STEP Proficiency Data Over a 2-Year Period by Cohort and Subgroup						
	Pre-Pandemic Cohorts (2017-2019)			Pandemic Cohorts (2019-2021)		
	3 <sup>rd</sup> -5 <sup>th</sup>	4 <sup>th</sup> -6 <sup>th</sup>	5 <sup>th</sup> -7 <sup>th</sup>	3 <sup>rd</sup> -5 <sup>th</sup>	4 <sup>th</sup> -6 <sup>th</sup>	5 <sup>th</sup> -7 <sup>th</sup>
All students enrolled both years	95.9	95.4	95.3	71.3	68.3	66.5
White	96.5	96.2	96.1	80.4	77.0	74.5
Black	94.1	93.0	92.5	45.2	42.8	42.1
Latino/a/x	95.1	94.9	95.0	63.9	61.0	59.1
Asian	96.3	96.2	96.6	67.9	64.3	64.0
Other Race/Ethnicity	95.9	94.1	94.5	69.2	65.6	62.4
Female	96.8	96.3	96.2	71.8	68.6	66.5
Male	95.1	94.6	94.5	70.9	67.9	66.6
Economically disadvantaged	94.6	93.8	93.5	64.5	60.6	58.4
Not economically disadvantaged	97.4	97.2	97.2	80.4	78.1	76.3
Special education	82.5	80.2	79.7	61.1	57.9	55.6
Not special education	98.3	98.0	98.0	73.2	70.1	68.4

*Notes: The percentages listed within each row represent the share of enrolled students from a particular grade and year combination with valid M-STEP Mathematics or ELA proficiency data. Students in the pre-pandemic cohorts had valid M-STEP Mathematics or ELA data in both 2017 and 2019. Students in the pandemic cohort had valid M-STEP Mathematics or ELA data in both 2019 and 2021. Across both cohorts, the columns represent the three different pairs of grade levels students were required to have valid M-STEP scores to be included in the analysis (e.g., 3<sup>rd</sup> grade in 2017 and 5<sup>th</sup> grade in 2019 for students in the pre-pandemic cohort). Source: M-STEP data is provided by MDE. Enrollment data is from CEPI's, Student Count Report.*

# Section Three:

## Results

In this section, we present multiple sets of results that summarize outcomes on both the Michigan benchmark assessments administered throughout the 2020-21 school year and M-STEP testing completed in spring 2021. First, we show fall and spring counts of the number and percentage of Michigan students who are “significantly behind grade level” on benchmark assessments, as well as distributions of scale scores, by student demographic characteristics, district-level instructional modality, and 2019 M-STEP proficiency levels. Next, we compare proficiency trends on the state’s M-STEP summative assessment before and during the COVID-19 pandemic. Finally, using a regression framework, we analyze both benchmark and M-STEP assessment outcomes by student demographic characteristics to gain a deeper understanding of subgroup-specific performance throughout the pandemic. In addition, the regression models tell us the relationship between instructional modality (remote, hybrid, or in-person) and growth on benchmark assessment or M-STEP outcomes over the 2020-21 school year.

To interpret the following results that discuss benchmark assessment outcomes, it is important to note that the definition of “significantly behind grade level” differs substantively across assessment providers. Similarly, each benchmark assessment has its own unique scale and scale scores are not comparable across assessments. We therefore analyze data from each provider separately and do not assume that “significantly behind grade level” classifications or average scale scores for one assessment translate to other assessments.

### BENCHMARK ASSESSMENT OUTCOMES BY STUDENT AND DISTRICT CHARACTERISTICS

The results in this section show fall and spring counts of the number and percentage of Michigan students who are “significantly behind grade level” on benchmark assessments, as well as average scale scores, across student demographic characteristics (race/ethnicity, gender, economically disadvantaged, and special

education status), district-level instructional modality, and 2019 M-STEP proficiency levels. In the Appendix, we also provide fall and spring counts of the number and percentage of Michigan students who are “significantly behind grade level” and average scale scores by English learner, foster, homeless, migrant, and military status (see Appendix Tables A.35 through A.114). We do not include analyses of these subgroups in the main text of the report because for many of the assessment providers, we have too few students to enable comparisons for these groups of students.

Within each table, we provide multiple measures to help interpret results and show changes throughout the school year for each student subgroup and grade level combination. Specifically, tables that provide fall and spring counts of the number and percentage of Michigan students who are “significantly behind grade level” on benchmark assessments also show gaps between each student subgroup and a specific reference category (e.g., White students are compared to other racial/ethnic subgroups). For tables that summarize average scale scores for each student subgroup, we also provide the standard deviation of each subgroup and grade level mean to help understand the variation in test scores within the subgroup, as well as gaps in average scale scores between each student subgroup and a specific reference category.

### **How to interpret “significantly behind grade level” gap tables in this report:**

In these tables, gaps in the percentages of students who are “significantly behind grade level” will be *positive* when the percentage for a subgroup (e.g., Black students) is larger than the percentage for the reference group (for the race/ethnicity comparisons, that group is White students). If a subgroup has a smaller percentage of students who are “significantly behind grade level” than the reference group, the gap will be *negative* (for instance, these percentages are often lower for Asian students than they are for White students. Thus, there are negative gaps in each semester, indicating that smaller percentages of Asian students are “significantly behind grade level” than White students at each point in time). In the table, we use parentheses to denote gaps that are negative.

When assessing the change in a gap between subgroups, we consider both the direction of the gap and whether the gap has grown or shrunk from fall to spring. In the table, we use plus and minus signs to convey information about the direction of the change in the achievement gap between two groups over the 2020-21 school year. A plus (+) sign indicates that a gap *increased* in magnitude from fall to spring and a minus (-) sign indicates that a gap *decreased* in magnitude. We use parentheses to indicate the direction of the gap relative to the reference group. That is, changes in negative gaps are shown in parentheses, along with a plus or minus sign to indicate whether the gap became larger or smaller in magnitude. For example, a value of “+5.5”

would indicate that the subgroup gap is positive (e.g., that the percentages of Black students who were “significantly behind grade level” were *higher* than the percentages of White students who were “significantly behind grade level” in both the fall and spring) and grew by 5.5 percentage points from fall to spring, while “-5.5” indicates that the gap is positive and shrunk by 5.5 percentage points. “(+5.5)” indicates that the gap is negative (e.g., that the percentages of Asian students who were “significantly behind grade level” were *lower* than the percentages of White students who were “significantly behind grade level” in both the fall and spring) and grew by 5.5 percentage points (e.g., the percentages for the subgroup and reference group moved farther apart from each other), and “(-5.5)” indicates that the gap is negative and shrunk by 5.5 percentage points (e.g., the subgroup percentages moved closer together). In rare cases, the direction of a gap may be different in the fall than in the spring; we label these gaps with the letter “R,” indicating that the gap reversed in direction.

### **How to interpret scale score gap tables in this report:**

These tables are interpreted differently than the tables showing the proportions of students who score “significantly behind grade level,” as the gaps in scale scores will be *negative* when a subgroup (e.g., Black students) scores lower, on average, than the reference group (again, for the race/ethnicity comparisons, that group is White students). Gaps will be *positive* when a subgroup scores higher than the reference group. For instance, Asian students generally score higher, on average, than do White students on the benchmark assessments. Thus, there are positive gaps in each semester, indicating that Asian students score higher, on average, than White students at each point in time. We use the same notation as in the “significantly behind grade level” gap tables to indicate the direction of each gap and whether they became larger or smaller in magnitude from fall to spring. For example, if economically disadvantaged students scored 6.0 points lower, on average, than students who are not economically disadvantaged in the fall, and they scored 10.0 points lower, on average, in the spring, the fall and spring gaps would be denoted as “(6.0)” and “(10.0)”, respectively. The fall-to-spring change in this gap would be denoted as “(+4.0),” using parentheses to indicate that both the fall and spring gaps were negative, and a plus sign to indicate that the magnitude of the gap increased (from 6.0 to 10.0).

We also provide standard deviations for the fall and spring average scale scores. Standard deviations are a measure of spread and provide information about how much scores varied across students within a particular subgroup. In other words, a smaller standard deviation indicates that students typically scored close to the group average, while a larger standard deviation indicates that many students scored far above or far below the group average. Additionally, large changes in standard deviations from fall to spring could indicate irregularities in students’ testing environments (e.g., due to remote testing in the fall but not the spring). In these cases, changes in average scores should be interpreted with caution.

Standard deviations are also helpful for judging the size of an achievement gap. For instance, if the gap in average scores for two groups of students is about 10% of the size of the standard deviation for the reference group, this tells us that the average score for the focal group is at about the 46<sup>th</sup> percentile of students in the reference group; similarly, if the gap is about half as large as the reference group's standard deviation, the average score for the focal group is at about the 31<sup>st</sup> percentile, and if the gap is about the same size as this standard deviation, the average score for the focal group is at about the 16<sup>th</sup> percentile. We can also use this method to compare gaps in average benchmark assessment scores to pre-pandemic achievement gaps found in other studies or using other assessments. For instance, on the 2019 M-STEP, gaps in average scores of Black and White students were about 75 to 87% of the size of the standard deviation for White students in ELA and 90 to 99% of a standard deviation in math, depending on the grade level. Latino/a/x-White gaps were about 39 to 43% of a standard deviation in ELA and 45 to 50% in math, and gaps between students who are and are not economically disadvantaged were 72 to 81% and 80 to 89% of a standard deviation in ELA and math, respectively. After accounting for changes in demographics from year to year, Matheny et al. (2021) found that from 2009 to 2018, the national Black-White gap widened by about 0.2% of a standard deviation on average each year, while the gap between students who are and are not economically disadvantaged widened by about 0.5% of a standard deviation, and the Latino/a/x-White gap narrowed by about 0.5% of a standard deviation.

All percentages, mean scale scores, fall-to-spring changes, and subgroup gaps shown in the “significantly behind grade level” and scale score tables are rounded to one decimal place. We calculated all fall-to-spring changes and subgroup gaps from the exact (unrounded) percentages and mean scale scores. This method ensures that our calculations are as precise as possible but means that some numbers may be slightly different than calculations based on the rounded percentages and mean scale scores shown in the tables.

## Race/Ethnicity

Table 3.1.1 through Table 3.1.12 show racial/ethnic differences in mathematics and reading benchmark assessment outcomes across the NWEA MAP Growth, Curriculum Associates i-Ready, and Renaissance Learning Star 360 assessments.

As mentioned in Section Two, the tables that summarize mathematics and reading differences among students in Smarter Balanced ICA and K-2 districts are often missing information for some subgroups, as we suppress outcomes for any student subgroup-grade combination with fewer than 10 students who participated in benchmark testing. In these cases, we refrain from drawing conclusions with those data as it is difficult to compare outcomes for a subset of students within a particular

student demographic characteristic. Appendix Tables A.17 and A.18 show the corresponding results for students who took the Smarter Balanced ICA and K-2 assessments; however, we do not interpret these tables because so few of the students in these districts are non-White.

Within each table, we report outcomes separately for White, Black, Latino/a/x, and Asian students. Due to the low number of students identified as American Indian or Alaskan Native and Native Hawaiian or Pacific Islander, we combined these groups with students identified as two or more races, to create a single "Other" category for the purposes of this report. Again, White students are the reference category for all outcome gaps (e.g., we estimate gaps between Black students and White students, gaps between Latino/a/x students and White students, gaps between Asian students and White students, and gaps between American Indian or Alaskan Native, Native Hawaiian or Pacific Islander, and multiracial students and White students).

As seen in Table 3.1.1 and Table 3.1.2, there are clear differences across each racial/ethnic subgroup in the percentage of students who scored "significantly behind grade level" on the NWEA MAP Growth Math and ELA assessments at the beginning and end of the 2020-21 school year. As a reminder, NWEA's definition of "significantly behind grade level" equates to students whose are projected to score "Not Proficient" on the MSTEP Mathematics or ELA assessments at the end of the school year.

For all grade levels and both subjects, lower percentages of White and Asian students in NWEA MAP Growth districts both started and ended the school year "significantly behind grade level," while greater percentages of Black, Latino/a/x, and Other race/ethnicity students scored "significantly behind grade level" in both time periods. For example, among 3<sup>rd</sup> graders in NWEA MAP Growth districts, almost 30% of White students scored "significantly behind grade level" on the mathematics assessment in both the fall and spring semesters. A smaller share of Asian students scored "significantly behind grade level" in mathematics during the same time periods (11% and 16% in the fall and spring, respectively). At the same time, roughly half of 3<sup>rd</sup>-grade Black (56%) and Latino/a/x students (46%) scored "significantly behind grade level" in fall, increasing to almost three-quarters of Black students (72%) and more than half of Latino/a/x students (52%) scoring "significantly behind grade level" in the spring semester. This suggests that 72% of Black and 52% of Latino/a/x students who took the 3<sup>rd</sup>-grade NWEA MAP Growth Math assessment were predicted to score "Not Proficient" on the M-STEP by the end of 2021.

Gaps in the percentage of students who scored "significantly behind grade level" between White students and other racial/ethnic subgroups also grew over the course of the year in both mathematics and reading. In particular, between the fall and spring semester, the Black-White mathematics gap for 3<sup>rd</sup> graders in MAP Growth districts

increased by 16 percentage points and Black students ended the year 43 percentage points more likely to score “significantly behind grade level” on the mathematics assessment compared to White students. The only subgroup of students that did not consistently follow this pattern were Asian students; in some cases, the gaps in the percentage of students who scored “significantly behind grade level” on the MAP Growth Math or Reading assessments between Asian and White students decreased over the course of the 2020-21 school year. When the Asian-White gaps did grow, they did so by relatively small amounts.

For students who took the Curriculum Associates i-Ready assessments (Table 3.1.3 and Table 3.1.4), mathematics and reading achievement at each grade level improved for all racial/ethnic subgroups over the course of the school year, and a smaller percentage of students in each subgroup scored “significantly behind grade level” in the spring semester compared to the fall. This is to be expected, given that the “significantly behind grade level” definition for the Curriculum Associates i-Ready assessment is based on a student’s knowledge at a given point in time and students should have learned more in the period between the fall and spring assessments. In other words, we would expect fewer students to be “two or more grade levels behind”—the i-Ready definition for “significantly behind grade level”—in the spring than in the fall.

Importantly, 1<sup>st</sup>- through 8<sup>th</sup>-grade Black and Latino/a/x students’ improvement throughout the school year reduced the Black-White and Latino/a/x-White mathematics gaps and the Latino/a/x-White reading gap by 1 to 7 percentage points across each grade level. For example, in fall of 2020, 47% of 5<sup>th</sup>-grade Latino/a/x students who took the Curriculum Associates i-Ready Mathematics assessment scored “significantly behind grade level,” relative to 26% of 5<sup>th</sup>-grade White students who took the assessment. Thus, 21% more Latino/a/x than White students were “significantly behind grade level” according to the 5<sup>th</sup>-grade Curriculum Associates i-Ready Mathematics assessment. By the spring assessment, 11% fewer Latino/a/x tested “significantly behind grade level,” whereas 9% fewer White students scored the same way. Thus, the Latino/a/x-White mathematics gap shrunk by 2 percentage points throughout the school year.

We do not find the same results for students who took the Renaissance Learning Star 360 Math assessment; while students in most subgroups were less likely to be “significantly behind grade level” in the spring than in the fall, in some grade levels *more* Black (four grade levels), Latino/a/x (five grade levels), and Asian students (three grade levels) scored “significantly behind grade level” in the spring than in the fall. These results are shown in Table 3.1.5 and Table 3.1.6. Moreover, the Black-White and Latino/a/x-White achievement gaps generally widened over the course of the year

in K-7<sup>th</sup> grade. Reading and literacy achievement gaps also increased between White and Black, Latino/a/x, and other groups in many grades.

Table 3.1.7 through Table 3.1.12 show fall and spring average mathematics and reading scale scores for all five racial/ethnic groups, as well as the change over time for each group, and score gaps for non-White groups relative to White students in the fall, spring, and the change over the year. Appendix Tables A.19 and A.20 show these results for students who took the Smarter Balanced ICA and K-2 Assessments (again, we do not interpret these tables because so few of the students in these districts are non-White).

As expected, the average mathematics and reading scale scores for all five racial/ethnic subgroups increased between the fall and spring semester. Across all grade levels, subjects, and assessment providers, Asian students both started and ended the year with the highest average scale scores. Excluding kindergarten, Black students in NWEA MAP Growth, Curriculum Associates i-Ready, and Renaissance Learning Star 360 districts consistently had the lowest average scale scores in both mathematics and reading in the fall and spring semesters. Average scale scores for White, Latino/a/x, and Other students in mathematics and reading fall between the average scores for Black and Asian students. Differences in average scale scores between White students and Latino/a/x or Other students are somewhat smaller than those between White and Black or Asian students, which is consistent with previous trends in M-STEP scores. The largest gaps between White and Black or Asian students, particularly those in the spring, are roughly equal to the standard deviations associated with White students.

Across both subjects and all grade levels, the gaps in average scale scores between White and Black, Latino/a/x, and Other students in NWEA MAP Growth and Renaissance Learning i-Ready districts grew consistently between the fall and spring semesters. These gaps became wider because, in both subjects, the increases in average scores for White students were larger than the increases for other racial/ethnic subgroups. Conversely, increases in Asian students' reading scale scores on both the NWEA MAP Growth and Curriculum Associates i-Ready assessments and mathematics scale scores on the Curriculum Associates i-Ready assessments were larger than the increases for White students. Since Asian students across most grade levels started the year with higher average scale scores than White students, this meant that the Asian-White average reading score gaps on both the NWEA MAP Growth and Curriculum Associates i-Ready assessments also increased over time, with Asian students ending the year farther ahead of White students, on average, than they were at the beginning of the year. The exception to this rule is for Asian-White gaps in average mathematics scale scores for elementary students in NWEA MAP Growth districts. These gaps generally decreased, as increases in average scores for White

students were smaller than those for Asian students. Again, even though average mathematics and reading scale score gaps between White students and other racial/ethnic subgroups in NWEA MAP Growth and Curriculum Associates i-Ready districts widened throughout 2020-21 school year, all the aforementioned gap changes varied in size, relative to the standard deviation for White students. These changes were largest for Black-White gaps, particularly in lower grade levels.

Finally, for Renaissance Learning Star 360 districts, Black-White mathematics and reading gaps across multiple grade levels were both large in the fall semester and increased dramatically through the spring.

Table 3.1.1. Percentage of Students “Significantly Behind Grade Level” on NWEA’s MAP Growth Mathematics Assessment by Race/Ethnicity								
Grade	Race/Ethnicity	N Tested	Percent “Significantly Behind”			Percentage Point Gap (Relative to White Students)

Notes: The "Score Gap" panel shows the differences between the average scale scores for a focal group and for a comparison (or reference) group. We use parentheses to denote gaps in which the reference group has a higher percentage than the focal group. Changes in these gaps reflect the change in the absolute value of the gap (e.g., a positive change indicates that the gap became larger in magnitude from fall to spring, regardless of the direction of the gap). Gaps that reverse in direction from fall to spring are denoted by the letter "R." All percentages, mean scale scores, fall-to-spring changes, and subgroup gaps shown in the "significantly behind grade level" and scale score tables are rounded to one decimal place. We calculated all fall-to-spring changes and subgroup gaps from the exact (unrounded) percentages and mean scale scores. This method ensures that our calculations are as precise as possible but means that some may be slightly different than calculations based on the rounded percentages and mean scale scores shown in the tables. Source: Student demographic data were obtained from the MSDS. School districts submitted benchmark assessment data directly to MDH, and these data were provided to EPIC through a collaboration between EPIC, MEDC, and MDE.

We use parentheses to denote gaps in which the reference group has a higher percentage than the focal group. Changes in these gaps reflect the change in the absolute value of the gap (e.g., a positive change indicates that the gap became larger in magnitude from fall to spring, regardless of the direction of the gap). Gaps that reverse in direction from fall to spring are denoted by the letter "R." All percentages, mean scale scores, fall-to-spring changes, and subgroup gaps shown in the "significantly behind grade level" and scale score tables are rounded to one decimal place. We calculated all fall-to-spring changes and subgroup gaps from the exact (unrounded) percentages and mean scale scores. This method ensures that our calculations are as precise as possible but means that some may be slightly different than calculations based on the rounded percentages and mean scale scores shown in the tables. Source: Student demographic data were obtained from the MSDS. School districts submitted benchmark assessment data directly to MDH, and these data were provided to EPIC through a collaboration between EPIC, MEDC, and MDE.

Notes: The “Score Gap” panel shows the differences between the average scale scores for a focal group and for a comparison (or reference) group. We use parentheses to denote gaps in which the reference group has a higher percentage than the focal group. Changes in these gaps reflect the change in the absolute value of the gap (e.g., a positive change indicates that the gap became larger in magnitude from fall to spring, regardless of the direction of the gap). Gaps that reverse in direction from fall to spring are denoted by the letter “R.” All percentages, mean scale scores, fall-to-spring changes, and subgroup gaps shown in the “significantly behind grade level” and scale score tables are rounded to one decimal place. We calculated all fall-to-spring changes and subgroup gaps from the exact (unrounded) percentages and mean scale scores. This method ensures that our calculations are as precise as possible but means that some may be slightly different than calculations based on the rounded percentages and mean scale scores shown in the tables. Source: Student demographic data were obtained from the MSDS. School districts submitted benchmark assessment data directly to MDH, and these data were provided to EPIC through a collaboration between EPIC, MEDC, and MDE.

## Gender

Table 3.2.1 through Table 3.2.16 summarize differences in benchmark assessment outcomes by gender. For these tables, we report outcomes separately for female students and male students and calculate outcome gaps using female students as the reference category.

Among districts that offered the MAP Growth assessments (Table 3.2.1 and Table 3.2.2), male students typically performed better in mathematics (except in K-1) while female students fared better in reading. A higher percentage of female students in 2<sup>nd</sup>-7<sup>th</sup> grade both started and ended the school year “significantly behind grade level” on the NWEA MAP Growth Mathematics assessment (approximately 25-40% and 35-50% in the fall and spring, respectively). Conversely, a greater percentage of male students across the same levels started and ended the school year “significantly behind grade level” in reading (approximately 30-33% and 35-40% in the fall and spring, respectively). The male-female student achievement gaps in mathematics became larger over the course of the year, while the male-female student reading achievement gap became smaller. The main exception is in middle school reading, where the male-female achievement gap grew over the year.

For Curriculum Associates i-Ready, Renaissance Learning Star 360, and Smarter Balanced ICA and K-2 districts (Table 3.2.3 through Table 3.2.8), the gender-subject relationships seen in NWEA MAP Growth districts were less pronounced. In general, more female students began the school year “significantly behind grade level” in mathematics, but the proportion of female students who were “significantly behind grade level” decreased over the year, effectively shrinking the gender achievement gaps by spring. Across assessment providers, consistently more male students scored “significantly behind grade level” in reading in the beginning of the year. In i-Ready districts, the proportion of female students “significantly behind grade level” decreased over the year, increasing the achievement gaps such that female students were even less likely than male students to be “significantly behind grade level” by the end of the year. There was no consistent pattern in gap changes in Renaissance Learning Star 360 or DRC Smarter Balanced ICA districts.

Table 3.2.9 through Table 3.2.16 show average scale scores by gender. Male students in NWEA MAP growth districts both began and ended the year with slightly higher average scores in mathematics (all grade levels except grade eight), while female students began and ended the year with higher average scores in reading across all grade levels. Similarly, for districts offering assessments from one of the other assessment providers, male students in K-6 grade levels typically ended the year with

higher scores in mathematics, and female students across all grade levels ended the year with higher scores in reading.

Overall, the male-female average scale score gaps for all assessment providers were relatively small, as were the changes in these gaps over time in most grades and subjects, relative to the standard deviations associated with female students (the reference group) for each grade level.

Table 3.2.1. Percentage of Students “Significantly Behind Grade Level” on NWEA’s MAP Growth Mathematics Assessment by Gender								
Grade	Gender	N Tested	Percent “Significantly Behind”			Percentage Point Gap (Relative to Female Students)		
			Fall	Spring	Change	Fall	Spring	Change
<b>K</b>	Female	18,203	9.7	20.4	+10.7			
	Male	19,170	12.0	21.0	+9.0	2.3	0.6	-1.6
<b>1st</b>	Female	21,330	22.0	27.3	+5.3

Changes in these gaps reflect the change in the absolute value of the gap (e.g., a positive change indicates that the gap became larger in magnitude from fall to spring, regardless of the direction of the gap). Gaps that reverse in direction from fall to spring are denoted by the letter “R.” All percentages, mean scale scores, fall-to-spring changes, and subgroup gaps shown in the “significantly behind grade level” and scale score tables are rounded to one decimal place. We calculated all fall-to-spring changes and subgroup gaps from the exact (unrounded) percentages and mean scale scores. This method ensures that our calculations are as precise as possible but means that some may be slightly different than calculations based on the rounded percentages and mean scale scores shown in the tables. Source: Student demographic data were obtained from the MSDS. School districts submitted benchmark assessment data directly to MDH, and these data were provided to EPIC through a collaboration between EPIC, MEDC, and MDE.

Notes: The “Score Gap” panel shows the differences between the average scale scores for a focal group and for a comparison (or reference) group. We use parentheses to denote gaps in which the reference group has a higher percentage than the focal group. Changes in these gaps reflect the change in the absolute value of the gap (e.g., a positive change indicates that the gap became larger in magnitude from fall to spring, regardless of the direction of the gap). Gaps that reverse in direction from fall to spring are denoted by the letter “R.” All percentages, mean scale scores, fall-to-spring changes, and subgroup gaps shown in the “significantly behind grade level” and scale score tables are rounded to one decimal place. We calculated all fall-to-spring changes and subgroup gaps from the exact (unrounded) percentages and mean scale scores. This method ensures that our calculations are as precise as possible but means that some may be slightly different than calculations based on the rounded percentages and mean scale scores shown in the tables. Source: Student demographic data were obtained from the MSDS. School districts submitted benchmark assessment data directly to MDH, and these data were provided to EPIC through a collaboration between EPIC, MEDC, and MDE.

School districts submitted benchmark assessment data directly to MDH, and these data were provided to EPIC through a collaboration between EPIC, MEDC, and MDE.

## Economically Disadvantaged Status

Table 3.3.1 through Table 3.3.16 summarize differences in benchmark assessment outcomes by economically disadvantaged status. For these tables, we report outcomes separately for students who are and are not economically disadvantaged, and the reference category for each table is students who were not economically disadvantaged.

Table 3.3.1 through Table 3.3.8 show differences in the percentages of students who are “significantly behind grade level” on all four assessments. Regardless of assessment provider or subject, a larger percentage of economically disadvantaged students across nearly all grade levels both started and ended the school year “significantly behind grade level” relative to students who were not economically disadvantaged. The only subgroups that did not follow this pattern were kindergarten (reading) and 1<sup>st</sup>-grade (mathematics) economically disadvantaged students in districts that offered the K-2 benchmark assessments.

For NWEA MAP Growth districts, increases in the proportion of economically disadvantaged students scoring “significantly behind grade level” in mathematics and reading were larger than for more advantaged students. As a result, the mathematics and reading gaps between economically disadvantaged and not economically disadvantaged students increased for all grade levels in these districts. We find similar changes in Renaissance Learning Star 360 districts between the fall and spring semesters. However, these gaps increased because the share of economically disadvantaged students that were “significantly below grade level” *decreased* between the fall and spring semesters but did so at a *slower* rate compared to more advantaged students, increasing mathematics and reading gaps for all grade levels except 7<sup>th</sup>-grade mathematics and 1<sup>st</sup>-grade reading.

Conversely, students in districts that administered the Curriculum Associates i-Ready assessments saw the gaps between students who are and are not economically disadvantaged decrease in both mathematics and reading for all grade levels other than kindergarten. While economically disadvantaged students consistently began and ended the year with more students scoring “significantly behind grade level,” decreases in the proportion of economically disadvantaged students scoring at that level for this group were larger compared to decreases among not economically disadvantaged students. This was also generally the case for students who took the Smarter Balanced ICA assessments.

Table 3.3.9 through Table 3.3.16 provide similar analyses for changes in scale score gaps between students who are and are not economically disadvantaged. Across all grades, subjects, and assessment providers, students who are economically

disadvantaged both started and ended the school year with lower average scale scores. Given these differences, there is a consistent gap between economically disadvantaged students and students who are not economically disadvantaged in both mathematics and reading, across all grades, subjects, and assessment providers in the fall semester. Further, these same gaps increased for nearly all grade levels between the fall and spring semester; average scale score increases for more advantaged students were larger than increases for economically disadvantaged students. The exceptions to this pattern are later grade levels for Curriculum Associates i-Ready districts, 1<sup>st</sup> graders in Star 360 districts, and some middle-grade levels for Smarter Balanced ICA districts.

Notes: The “Percentage Point Gap” panel shows the differences between the shares of students who are “significantly behind grade level” for a focal group and for a comparison (or reference) group. We use parentheses to denote gaps in which the reference group has a higher percentage than the focal group. Changes in these gaps reflect the change in the absolute value of the gap (e.g., a positive change indicates that the gap became larger in magnitude from fall to spring, regardless of the direction of the gap). Gaps that reverse in direction from fall to spring are denoted by the letter “R.” All percentages, mean scale scores, fall-to-spring changes, and subgroup gaps shown in the “significantly behind grade level” and scale score tables are rounded to one decimal place. We calculated all fall-to-spring changes and subgroup gaps from the exact (unrounded) percentages and mean scale scores. This method ensures that our calculations are as precise as possible but means that some may be slightly different than calculations based on the rounded percentages and mean scale scores shown in the tables. Source: Student demographic data were obtained from the MSDS. School districts submitted benchmark assessment data directly to MDH, and these data were provided to EPIC through a collaboration between EPIC, MEDC, and MDE.

Notes: The “Score Gap” panel shows the differences between the average scale scores for a focal group and for a comparison (or reference) group. We use parentheses to denote gaps in which the reference group has a higher percentage than the focal group. Changes in these gaps reflect the change in the absolute value of the gap (e.g., a positive change indicates that the gap became larger in magnitude from fall to spring, regardless of the direction of the gap). Gaps that reverse in direction from fall to spring are denoted by the letter “R.” All percentages, mean scale scores, fall-to-spring changes, and subgroup gaps shown in the “significantly behind grade level” and scale score tables are rounded to one decimal place. We calculated all fall-to-spring changes and subgroup gaps from the exact (unrounded) percentages and mean scale scores. This method ensures that our calculations are as precise as possible but means that some may be slightly different than calculations based on the rounded percentages and mean scale scores shown in the tables. Source: Student demographic data were obtained from the MSDS. School districts submitted benchmark assessment data directly to MDH, and these data were provided to EPIC through a collaboration between EPIC, MEDC, and MDE.

Notes: The "Score Gap" panel shows the differences between the average scale scores for a focal group and for a comparison (or reference) group. We use parentheses to denote gaps in which the reference group has a higher percentage than the focal group. Changes in these gaps reflect the change in the absolute value of the gap (e.g., a positive change indicates that the gap became larger in magnitude from fall to spring, regardless of the direction of the gap). Gaps that reverse in direction from fall to spring are denoted by the letter "R." All percentages, mean scale scores, fall-to-spring changes, and subgroup gaps shown in the "significantly behind grade level" and scale score tables are rounded to one decimal place. We calculated all fall-to-spring changes and subgroup gaps from the exact (unrounded) percentages and mean scale scores. This method ensures that our calculations are as precise as possible but means that some may be slightly different than calculations based on the rounded percentages and mean scale scores shown in the tables. Source: Student demographic data were obtained from the MSDS. School districts submitted benchmark assessment data directly to MDH, and these data were provided to EPIC through a collaboration between EPIC, MEDC, and MDE.

## Special Education Status

Table 3.4.1 through Table 3.4.16 summarize differences in benchmark assessment outcomes by special education status. For these tables, outcomes for special and general education students are reported separately, and the reference category for outcome gaps is general education students.

As shown in Table 3.4.1 through Table 3.4.8, larger percentages of special education students across nearly all grade levels, subjects, and assessment providers both started and ended the school year “significantly behind grade level.” Kindergarten (ELA) and 2<sup>nd</sup>-grade (ELA) special education students in districts that offered Smarter Balanced ICA and K-2 assessments were the only grade-specific subgroups where a larger percentage of general education than special education students scored “significantly behind grade level” in the fall. Gap changes in the percentage of students who scored “significantly behind grade level” were far less consistent across grades, vendors, and subject.

Mathematics and reading gaps between special and general education students typically increased in the lowest (K-3) grade levels for students who took the NWEA MAP Growth assessments and for students in middle school grade levels who took the Curriculum Associates i-Ready and the Smarter Balanced ICA Mathematics assessments. In NWEA MAP Growth districts, gaps increased because changes in the proportion of special education students scoring “significantly behind grade level” were larger between the fall and spring compared to general education students. Conversely, in Curriculum Associates i-Ready and Smarter Balanced ICA districts, decreases in the proportion of students scoring “significantly behind grade level” between the fall and spring were smaller for special education relative to general education students.

Gaps between special education and general education students typically decreased for students taking the NWEA MAP Growth Mathematics and Reading assessments in later grades, and for students in 1<sup>st</sup>-5<sup>th</sup> grades in districts that administered the Curriculum Associates i-Ready assessments. They also largely decreased for students in districts administering the Renaissance Learning Star assessment in both reading and math.

Table 3.4.9 through Table 3.4.16 show scale score gaps for special education relative to general education students. General education students had higher average scale scores compared to special education students across all grade levels and assessment providers. General education students in NWEA MAP Growth districts experienced larger increases in scores during the school year relative to special education students, widening gaps across all grade levels in mathematics and for K-2 in reading. In

contrast, increases in special education students’ average reading scale scores were larger than their general education peers in 3<sup>rd</sup>-8<sup>th</sup> grades, although the relative differences over time were very small. Students in Curriculum Associates i-Ready districts experienced increases in gaps between special and general education students for the most part, with some exceptions in the early grades for mathematics and later grade levels for reading.

For Renaissance Learning Star 360 and Smarter Balanced ICA and K-2 districts, mathematics and reading gaps between special and general education for the most part increased across both subjects and all grade levels.

	Spec. Ed.	47	85.1	72.3	-12.8	44.4	38.8	-5.6	

Notes: The “Percentage Point Gap” panel shows the differences between the shares of students who are “significantly behind grade level” for a focal group and for a comparison (or reference) group. We use parentheses to denote gaps in which the reference group has a higher percentage than the focal group. Changes in these gaps reflect the change in the absolute value of the gap (e.g., a positive change indicates that the gap became larger in magnitude from fall to spring, regardless of the direction of the gap). Gaps that reverse in direction from fall to spring are denoted by the letter “R.” All percentages, mean scale scores, fall-to-spring changes, and subgroup gaps shown in the “significantly behind grade level” and scale score tables are rounded to one decimal place. We calculated all fall-to-spring changes and subgroup gaps from the exact (unrounded) percentages and mean scale scores. This method ensures that our calculations are as precise as possible but means that some may be slightly different than calculations based on the rounded percentages and mean scale scores shown in the tables. Source: Student demographic data were obtained from the MSDS. School districts submitted benchmark assessment data directly to MDH, and these data were provided to EPIC through a collaboration between EPIC, MEDC, and MDE.

Notes: The “Score Gap” panel shows the differences between the average scale scores for a focal group and for a comparison (or reference) group. We use parentheses to denote gaps in which the reference group has a higher percentage than the focal group. Changes in these gaps reflect the change in the absolute value of the gap (e.g., a positive change indicates that the gap became larger in magnitude from fall to spring, regardless of the direction of the gap). Gaps that reverse in direction from fall to spring are denoted by the letter “R.” All percentages, mean scale scores, fall-to-spring changes, and subgroup gaps shown in the “significantly behind grade level” and scale score tables are rounded to one decimal place. We calculated all fall-to-spring changes and subgroup gaps from the exact (unrounded) percentages and mean scale scores. This method ensures that our calculations are as precise as possible but means that some may be slightly different than calculations based on the rounded percentages and mean scale scores shown in the tables. Source: Student demographic data were obtained from the MSDS. School districts submitted benchmark assessment data directly to MDH, and these data were provided to EPIC through a collaboration between EPIC, MEDC, and MDE.

Source: Student demographic data were obtained from the MSDS. School districts submitted benchmark assessment data directly to MDH, and these data were provided to EPIC through a collaboration between EPIC, MEDC, and MDE.

## Instructional Modality

Table 3.5.1 through Table 3.5.8 summarize differences in benchmark assessment outcomes by instructional modality for the NWEA MAP Growth and Curriculum Associates i-Ready assessments. Appendix Tables A.21 through A.28 show the corresponding results for the Renaissance Learning Star 360 and Smarter Balanced ICA and K-2 assessments, but we do not interpret these tables because most of these districts were in-person for the entirety of the school year.

We compare benchmark outcomes across districts that offered only in-person, hybrid, or remote instruction during both the fall and spring benchmark administration periods (i.e., “In-Person All Year,” “Hybrid All Year,” and “Remote All Year,” respectively); districts that offered in-person instruction during one administration period and hybrid or remote instruction during the other period (i.e., “In-Person Part-Year”); and districts that offered hybrid instruction during one administration period and remote instruction during the other period (i.e., “Hybrid Part-Year”). Results are presented separately for each instructional modality, and districts that were “In-Person All Year” are the reference category when calculating outcome gaps.

As mentioned earlier, district-level instructional modality decisions changed throughout the school year. These changes highlight potentially irregular testing environments for some students between the fall and spring assessment periods which may lead to inflated fall scale scores among students who were tested remotely and had access to additional resources (e.g., parental help), especially among students in “Remote All Year” districts.

For NWEA MAP Growth districts (Table 3.5.1 and Table 3.5.2), students in grades one through eight who were remote during both benchmark testing administrations (“Remote All Year”) started and ended the year with the highest percentage of students scoring “significantly below grade level” in both mathematics and reading. First through 8<sup>th</sup>-grade students who were “In-Person All Year” or “In-Person Part-Year” typically started and ended the year with the lowest percentage of students scoring “significantly below grade level” in both mathematics and reading.

For nearly every instructional modality and grade level, the percentage of students in NWEA MAP Growth districts who scored “significantly behind grade level” in mathematics and reading grew throughout the 2020-21 school year (“In-Person All Year” districts were the only subgroup that saw declining proportions of “significantly behind grade level” students in a few early grade levels). However, any increase in the proportion of students scoring “significantly behind grade level” for “In-Person All Year” districts was consistently smaller than increases for districts offering other instructional modalities, hence, gaps between students who were in “In-Person All

Year" districts and students in districts offering other modalities grew for almost all subgroups.

The only subgroup where this trend did not hold was for students in "In-Person Part-Year" districts. For example, among 2<sup>nd</sup>-grade NWEA MAP Growth students, 6 percentage points fewer students in "In-Person Part-Year" districts scored "significantly behind grade level" in mathematics in the fall compared to students in "In-Person All-Year" districts. By the spring, that gap reversed and three percentage points more students in "In-Person Part-Year" districts scored "significantly behind grade level" compared to students "In-Person All Year" districts. In other words, the initial fall disparity between students in "In-Person Part-Year" and "In-Person All Year" districts compensated for the larger change in the percentage of students who scored "significantly behind grade level" in "In-Person Part-Year" districts and effectively lowered that subgroup gap.

The most alarming increases in gaps between modalities occurred for students enrolled in "Remote All Year" districts. For instance, while 26% of "Remote All Year" 1<sup>st</sup> graders scored "significantly behind grade level" on the fall mathematics NWEA MAP growth assessment, this increased to 47% by the spring test, for an increase of 21 percentage points. This was relative to a 2% *decrease* in the percentage of "In-Person All Year" students who scored "significantly behind grade level" over the course of the 2020-21 school year, and the gap between these groups grew from two to 25 percentage points by spring 2021. These gap increases were, for the most part, larger in magnitude in reading than in mathematics, especially for later grades.

Similar to NWEA MAP Growth districts, 2<sup>nd</sup>-8<sup>th</sup>-grade students in Curriculum Associates i-Ready districts who were "Remote All Year" started and ended the year with the highest percentage of students scoring "significantly below grade level." This group usually experienced smaller decreases, and sometimes increases, in the percentage of students scoring "significantly below grade level" between the fall and spring compared to a consistently declining proportion of students in "In-Person All Year" districts who scored the same way. Thus, mathematics and reading gaps between these two subgroups increased across all grade levels. For example, among 3<sup>rd</sup>-grade Curriculum Associates i-Ready students in "Remote All Year" districts, 15 percentage points more students scored "significantly behind grade level" in mathematics in the fall and 33 percentage points more in the spring, equaling an 18 percentage point gap increase in the share of students scoring "significantly behind grade level" compared to students in "In-Person All Year" districts.

We note that we see some inconsistencies in the fall data for kindergarten and 1<sup>st</sup> graders. In particular, data from the Curriculum Associates i-Ready districts suggest that much lower proportions of kindergarten and 1<sup>st</sup>-grade students in remote and

hybrid districts were testing “significantly below grade level” than in later grades, and even in some cases than students in districts operating in-person. This may be due in part to the fact that Curriculum Associates’ definitions for “significantly behind grade level” on the i-Ready assessments are slightly different for K-1 students than for students in later grades. However, we find similar patterns in the scale score data as well. One possible explanation is that K-1 students who took the assessments remotely had assistance from their caregivers at home, thus making it hard to discern their true skill level from the assessments.

Table 3.5.5 and Table 3.5.6 provide average scale scores for students in NWEA MAP Growth districts across instructional modalities. We find that within grade levels, average scale scores at the start of the school year were relatively similar across modalities. Across grades 3-8, students in “Remote All Year” districts scored slightly lower in the fall in both mathematics and reading compared to their counterparts in districts offering some form of in-person instruction, while students in “In-Person All Year” or “In-Person Part-Year” districts typically scored the highest. Average scale score differences in mathematics and reading between students in “In-Person All Year” districts and those in “Remote All Year” districts were about 30 to 50% of the size of the standard deviation associated with “In-Person All Year” students at the beginning of the school year, meaning that the average student in a “Remote All Year” district scored between the 31<sup>st</sup> and 38<sup>th</sup> percentiles for “In-Person All Year” districts.

Between the fall and spring semesters, NWEA MAP Growth average scale scores in both mathematics and reading increased for all subgroups and across all grade levels. However, increases among students in “Remote All Year” districts were almost always smaller than those of students in “In-Person All Year” districts,” and gaps between these groups increased throughout the school year for 1<sup>st</sup>-8<sup>th</sup> grade. In fact, in 3<sup>rd</sup>-8<sup>th</sup> grades, mathematics and reading gaps between students in “In-Person All Year” districts and those in districts offering hybrid or remote instruction all increased between the fall and spring.

Similar to NWEA MAP Growth districts, students in Curriculum Associates i-Ready districts exhibited modest differences in average scale scores in both subjects at the start of the school year. Third through 8<sup>th</sup>-grade students in “Remote All Year” districts had the lowest fall average scale scores in mathematics and reading, while students in “In-Person Part-Year” and “Hybrid All Year” districts had the highest average scale scores. Average mathematics and reading scale score differences between students in “In-Person All Year” districts and those in “Remote All Year” districts were roughly 20 to 40% of the size of the standard deviation associated with “In-Person All Year” districts, suggesting that the average student in a “Remote All Year” district scored between the 34<sup>th</sup> and 42<sup>nd</sup> percentiles for students in “In-Person All Year” districts in the fall.

As discussed above, we found some puzzling inconsistencies in early grades scale score data in Curriculum Associates i-Ready districts; K-3 students in "Remote All Year" districts were the only subgroup to see decreases in average scale scores between the fall and spring. Again, this may be related to remote testing irregularities inflating fall scores. Groups with fall-spring decreases in average scale scores all had the highest standard deviations in the fall and lower standard deviations in the spring, signaling a change in the overall distribution of scores for each specific group.

Concerning fall-to-spring gap changes, average mathematics and reading scale score increases for students in "In-Person All Year" districts were typically larger than those for students in "In-Person Part-Year," "Hybrid Part-Year," and "Remote All Year" districts, but smaller than those for students in "Hybrid All Year" districts. Hence, given initial average scale score gaps in the fall, mathematics and reading gaps for students in "Remote All Year" and "Hybrid Part-Year" typically increased while gaps for "In-Person Part-Year" students always decreased.

Table 3.5.1. Percentage of Students “Significantly Behind Grade Level” on NWEA’s MAP Growth Math Assessment by Modality								
Grade	Modality	N Tested	Percent “Significantly Behind”			Percentage Point Gap (Relative to In-Person All Year)		
			Fall	Spring	Change	Fall	Spring	Change
<b>K</b>	In-Person All Year	19,521	11.4	19.1	+7.6

Notes: Additional information for this table can be found in Report Note 6 at the end of this report.

## 2019 M-STEP Proficiency Levels

Table 3.6.1 through Table 3.6.16 summarize differences in benchmark assessment outcomes by 2019 M-STEP proficiency levels. We present results separately for students who scored “Not Proficient,” “Partially Proficient,” “Proficient,” and “Advanced” on the 2019 mathematics and ELA assessments, and students who were “Proficient” in 2019 were the reference category when calculating outcome gaps. Because students do not take the M-STEP until the 3<sup>rd</sup> grade, and the most recent M-STEP before the 2020-21 school year was taken in 2019, this portion of our analysis is constrained to the 5<sup>th</sup>-8<sup>th</sup> grades.

Across all grades, subjects, and assessment providers, 2019 M-STEP proficiency levels were clearly related to the percentage of students scoring “significantly behind grade level” in both the fall and spring for each subgroup; students who scored “Not Proficient” on the 2019 M-STEP both started and ended the year with the largest percentage of students scoring “significantly behind grade level,” followed by students who scored “Partially Proficient,” and “Proficient.” Students who scored “Advanced” on the 2019 M-STEP both started and ended 2020-21 school year with the lowest percentage of students scoring “significantly behind grade level.”

Notably, in NWEA MAP Growth districts, a higher percentage of students across all grades, subjects, and 2019 M-STEP proficiency levels scored “significantly behind grade level” at the end of the school year compared to the beginning. This implies that all students progressed at a slower rate this year than would have been expected in a pre-pandemic year, regardless of their prior achievement level. Further, across all grade levels in NWEA MAP Growth districts, there were large increases in the percent of students who scored “significantly behind grade level” by the end of the year among those who had scored “Partially Proficient” on the 2019 M-STEP. These changes lead to larger spring mathematics and reading gaps between students scoring “Partially Proficient” and “Proficient” on the 2019 M-STEP, suggesting that the students who were struggling yet not “significantly below grade level” before the pandemic were the most hurt by the pandemic school year. Together, these consistent increases in the proportion of students scoring “significantly behind grade level” for all prior proficiency levels exacerbated the pre-existing gaps between “Proficient” students and those in the lower proficiency levels (“Not Proficient” and “Partially Proficient”). While students who scored “Advanced” in the 2018-2019 school year also saw increases in the percentage of students who were “significantly behind grade level” over the 2020-21 school year these increases were very small and led to large gaps between “Advanced” and “Proficient” groups of students.

For students in Curriculum Associates i-Ready districts, both mathematics and reading gaps across all grade levels decreased between students who scored "Proficient" on the 2019 M-STEP and those who scored at any other proficiency level. These changes occurred because a large proportion of "Not Proficient" and "Partially Proficient" students scored "significantly behind grade level" in the fall and fall-to-spring decreases in the proportion of students scoring "significantly behind grade level" were greater for these groups relative to students who scored "Proficient" on the 2019 M-STEP. Similarly, fall-to-spring decreases for "Advanced" students were smaller relative to students who scored "Proficient" on the 2019 M-STEP, decreasing gaps across both subjects and all grade levels.

In Renaissance Learning Star 360 districts, we see similar gap decreases between students who scored "Proficient" on the 2019 M-STEP and those who scored "Not Proficient" or "Partially Proficient" except for students in 8<sup>th</sup> grade. Finally, for Smarter Balanced ICA districts, the gaps between students who scored "Not Proficient" and "Proficient" increased in mathematics and decreased in reading across most grade levels, while gaps between "Partially Proficient" and "Proficient" students decreased in both subjects and all grade levels.

Table 3.6.9 through Table 3.6.16 show the same analyses, but for average scale scores. Across all assessment providers, both subjects, and both testing periods, average scale scores for students who scored "Not Proficient" or "Partially Proficient" on the 2019 M-STEP lagged students who scored "Proficient" on the same assessment. Conversely, "Proficient" students, on average, scored lower compared to students who scored "Advanced" on the 2019 M-STEP. Further, across all assessment providers and nearly all grade levels, students in each prior proficiency level, on average, saw increases in both mathematics and reading scale scores between the fall and spring (except 8<sup>th</sup>-grade "Not Proficient" students in Smarter Balanced ICA districts).

The magnitude of these increases in average scale scores from fall to spring differ across 2019 M-STEP proficiency levels, with average scores for "Not Proficient" and "Advanced" students typically increasing the least and most, respectively, across all vendors, grades, and subjects. Across all prior proficiency and grade levels, mathematics gaps between each student subgroup and those who scored "Proficient" on the 2019 M-STEP always increased. This trend holds for reading gaps across most grade levels, however, there were a few instances where reading gaps between "Proficient" students and students in other proficiency levels decreased slightly by the spring (i.e., 8<sup>th</sup>-grade reading gaps for i-Ready "Not Proficient," i-Ready "Advanced," and Star 360 "Advanced" students). It is important to note that for students who took the NWEA MAP Growth and Curriculum Associate i-Ready assessments, the changes in average scale score achievement gaps over the course of the 2020-21 school year were quite small.

Table 3.6.1. Percentage of Students “Significantly Behind Grade Level” on NWEA’s MAP Growth Mathematics Assessment by 2019 M-STEP Proficiency								
Grade	2019 Math Proficiency	N Tested	Percent “Significantly Behind”			Percentage Point Gap (Relative to Proficient)		
			Fall	Spring	Change	Fall	Spring	Change
<b>5th</b>	Not Proficient	12,068	86.0	90.8	+4.7	75.9	69.9	-6.0
	Partially Proficient	12,547	44.8	59.7	+14.9	34.7	38.9	+4.2
	Proficient	13,368	10.1	20.8	+10.7			
	Advanced	9,536	1.2	2.9	+1.8	(9.0)	(17.9)	(+8.9)
<b>6th</b>	Not Proficient	10,402	86.5	92.3	+5.8	80.2	81.6	+1.4
	Partially Proficient	16,069	37.5	49.9	+12.4	31.3	39.2	+7.9
	Proficient	12,777	6.2	10.7	+4.4			
	Advanced	8,449	0.6	1.1	+0.5	(5.6)	(9.6)	(+4.0)
<b>7th</b>	Not Proficient	16,055	78.4	84.3	+6.0	74.2	77.7	+3.5
	Partially Proficient	14,436	25.5	34.0	+8.6	21.3	27.4	+6.1
	Proficient	9,156	4.1	6.6	+2.5			
	Advanced	8,528	0.3	0.7	+0.4	(3.8)	(5.9)	(+2.1)
<b>8th</b>	Not Proficient	15,117	66.8	78.9	+12.2	65.7	76.5	+10.8
	Partially Proficient	15,174	12.9	23.4	+10.5	11.8	21.0	+9.2
	Proficient	9,607	1.1	2.4	+1.3			
	Advanced	7,612	0.1	0.3	+0.2	(0.9)	(2.1)	(+1.1)

Notes: The “Percentage Point Gap” panel shows the differences between the shares of students who are “significantly behind grade level” for a focal group and for a comparison (or reference) group. We use parentheses to denote gaps in which the reference group has a higher percentage than the focal group. Changes in these gaps reflect the change in the absolute value of the gap (e.g., a positive change indicates that the gap became larger in magnitude from fall to spring, regardless of the direction of the gap). Gaps that reverse in direction from fall to spring are denoted by the letter “R.” All percentages, mean scale scores, fall-to-spring changes, and subgroup gaps shown in the “significantly behind grade level” and scale score tables are rounded to one decimal place. We calculated all fall-to-spring changes and subgroup gaps from the exact (unrounded) percentages and mean scale scores. This method ensures that our calculations are as precise as possible but means that some may be slightly different than calculations based on the rounded percentages and mean scale scores shown in the tables. Source: M-STEP data were provided to EPIC by MDE. School districts submitted benchmark assessment data directly to MDH, and these data were provided to EPIC through a collaboration between EPIC, MEDC, and MDE.

Notes: The “Percentage Point Gap” panel shows the differences between the shares of students who are “significantly behind grade level” for a focal group and for a comparison (or reference) group. We use parentheses to denote gaps in which the reference group has a higher percentage than the focal group. Changes in these gaps reflect the change in the absolute value of the gap (e.g., a positive change indicates that the gap became larger in magnitude from fall to spring, regardless of the direction of the gap). Gaps that reverse in direction from fall to spring are denoted by the letter “R.” All percentages, mean scale scores, fall-to-spring changes, and subgroup gaps shown in the “significantly behind grade level” and scale score tables are rounded to one decimal place. We calculated all fall-to-spring changes and subgroup gaps from the exact (unrounded) percentages and mean scale scores. This method ensures that our calculations are as precise as possible but means that some may be slightly different than calculations based on the rounded percentages and mean scale scores shown in the tables. Source: M-STEP data were provided to EPIC by MDE. School districts submitted benchmark assessment data directly to MDH, and these data were provided to EPIC through a collaboration between EPIC, MEDC, and MDE.

Notes: The "Score Gap" panel shows the differences between the average scale scores for a focal group and for a comparison (or reference) group. We use parentheses to denote gaps in which the reference group has a higher percentage than the focal group. Changes in these gaps reflect the change in the absolute value of the gap (e.g., a positive change indicates that the gap became larger in magnitude from fall to spring, regardless of the direction of the gap). Gaps that reverse in direction from fall to spring are denoted by the letter "R." All percentages, mean scale scores, fall-to-spring changes, and subgroup gaps shown in the "significantly behind grade level" and scale score tables are rounded to one decimal place. We calculated all fall-to-spring changes and subgroup gaps from the exact (unrounded) percentages and mean scale scores. This method ensures that our calculations are as precise as possible but means that some may be slightly different than calculations based on the rounded percentages and mean scale scores shown in the tables. Source: M-STEP data were provided to EPIC by MDE. School districts submitted benchmark assessment data directly to MDH, and these data were provided to EPIC through a collaboration between EPIC, MEDC, and MDE.

School districts submitted benchmark assessment data directly to MDH, and these data were provided to EPIC through a collaboration between EPIC, MEDC, and MDE.

## Socioeconomic Achievement Gaps Among Students with the Same Prior M-STEP Proficiency Levels

Considering these strong associations between prior (2019) proficiency levels and performance on fall and spring benchmark assessments, it is likely that some of the relationships we saw in our comparisons across demographic subgroups are driven, at least in part, by differences in achievement that pre-date the pandemic. For instance, as we discussed earlier in this section, there are consistent achievement gaps between students of different socioeconomic statuses and racial/ethnic subgroups, and many of these gaps grew larger over the course of the 2020-21 school year. However, changes in the gaps may not have affected all students within a given socioeconomic or racial/ethnic group equally. To delve deeper into these patterns, we compare gaps between demographic groups, as well as fall-to-spring changes in these gaps, across subgroups of students who had the same prior proficiency levels on the 2019 M-STEP assessment. We focus on socioeconomic achievement gaps only, and not on racial/ethnic achievement gaps, as the number of students within each combination of a prior proficiency level and economically disadvantaged status is large enough for us to compare these patterns for most grade levels, subjects, and assessment providers, while the sample sizes are too small to do many of the corresponding comparisons by race/ethnicity or other subgroups.

Table 3.7.1 through Table 3.7.16 summarize differences in benchmark assessment outcomes by combinations of 2019 M-STEP proficiency levels and economically disadvantaged status. We present results for each 2019 M-STEP proficiency level, economically disadvantaged status, and grade level combination separately, and students that were not considered economically disadvantaged within each modality were the reference category when calculating outcome gaps for economically disadvantaged students in the same grade with the same prior proficiency level.

For NWEA MAP Growth, Curriculum Associates i-Ready, and Renaissance Learning Star 360 districts, regardless of students' prior proficiency levels, higher percentages of economically disadvantaged students scored "significantly behind grade level" in both the fall and the spring semesters compared to their more advantaged peers, and this pattern is consistent across both subjects and nearly all grade levels. For Smarter Balanced ICA districts, this pattern also generally holds, however, there are a few exceptions where economically disadvantaged students who scored "Advanced" on the 2019 M-STEP outperformed students not considered economically disadvantaged in the fall. In each of these instances, there were few economically disadvantaged students in these districts who scored "Advanced" on the 2019 M-STEP to begin with, and none of them were considered "significantly behind grade level" in fall 2020.

Before moving on to a discussion of gaps, it is important to pause to examine the proportion of students who are scoring “significantly behind grade level” in some subsets of students. In particular, 93% and 94% of economically disadvantaged 5<sup>th</sup>- and 6<sup>th</sup>-grade students who scored “Not Proficient” on their 2019 M-STEP mathematics tests scored “significantly behind grade level” on the NWEA MAP Growth Math assessment by spring of 2021, as did 88% of 7<sup>th</sup> graders and 83% of 8<sup>th</sup> graders in the same category. These numbers are not quite as stark for reading outcomes for the students in NWEA MAP Growth districts, but still approximately three-quarters or more of the economically disadvantaged students who scored “Not Proficient” on their 2019 M-STEP ELA assessment scored “significantly behind grade level” by the spring of 2021. This trend is similar for students in districts taking the other three benchmark assessments. The one exception is for students in districts offering the Smarter Balanced ICA ELA assessment. However, there were so few economically disadvantaged students in those districts that we do not put much weight on those results.

When we examine average scale scores for students by economic disadvantage and 2019 M-STEP proficiency level (Table 3.7.9 through Table 3.7.16), we find that across all grades, subjects, and assessment providers, average scale scores in the fall were higher for students who were not economically disadvantaged. In both the fall and spring, gaps between students who are and are not economically disadvantaged tended to be slightly larger among those who scored in the lowest or highest possible proficiency levels on the 2019 M-STEP (“Not Proficient” and “Advanced,” respectively), compared to those who scored “Partially Proficient” or “Proficient.”

For NWEA MAP Growth districts, average mathematics and reading scale score increases throughout the school year were typically larger among the more advantaged students and these gaps became larger between the fall and spring for nearly all grade levels and 2019 M-STEP proficiency levels. For most subjects and grade levels, gap changes in Curriculum Associates i-Ready and Renaissance Learning Star 360 districts were consistent with this pattern. However, as we noted in our overall comparisons by economically disadvantaged status, there were a few grade levels and subjects where the gaps decreased slightly. For these same grade levels and subjects, we now see that these decreases sometimes were, and sometimes were not, uniform across students with different 2019 M-STEP proficiency levels. For instance, in Curriculum Associates i-Ready districts, 8<sup>th</sup>-grade mathematics gaps decreased across all prior proficiency levels, while 8<sup>th</sup>-grade reading gaps increased for students with the highest and lowest prior proficiency levels and decreased for students in the middle two levels.

In contrast to districts using any of the other assessment providers, in Smarter Balanced ICA districts many of the gaps between economically disadvantaged

students and students who were not economically disadvantaged *decreased* between the fall and spring, some groups of economically disadvantaged students in these districts ended the school year with higher average scores than their more advantaged peers with the same prior proficiency levels. However, we once again stress that there are relatively few economically disadvantaged students in these districts, and even fewer after disaggregating by prior achievement level, making it difficult to draw any inferences about these districts.

*Notes: The "Percentage Point Gap" panel shows the differences between the shares of students who are "significantly behind grade level" for a focal group and for a comparison (or reference) group. We use parentheses to denote gaps in which the reference group has a higher percentage than the focal group. Changes in these gaps reflect the change in the absolute value of the gap (e.g., a positive change indicates that the gap became larger in magnitude from fall to spring, regardless of the direction of the gap). Gaps that reverse in direction from fall to spring are denoted by the letter "R." All percentages, mean scale scores, fall-to-spring changes, and subgroup gaps shown in the "significantly behind grade level" and scale score tables are rounded to one decimal place. We calculated all fall-to-spring changes and subgroup gaps from the exact (unrounded) percentages and mean scale scores. This method ensures that our calculations are as precise as possible but means that some may be slightly different than calculations based on the rounded percentages and mean scale scores shown in the tables. Source: Student demographic data were obtained from the MSDS. M-STEP data were provided to EPIC by MDE. School districts submitted benchmark assessment data directly to MDH, and these data were provided to EPIC through a collaboration between EPIC, MEDC, and MDE.*

Notes: The “Percentage Point Gap” panel shows the differences between the shares of students who are “significantly behind grade level” for a focal group and for a comparison (or reference) group. We use parentheses to denote gaps in which the reference group has a higher percentage than the focal group. Changes in these gaps reflect the change in the absolute value of the gap (e.g., a positive change indicates that the gap became larger in magnitude from fall to spring, regardless of the direction of the gap). Gaps that reverse in direction from fall to spring are denoted by the letter “R.” All percentages, mean scale scores, fall-to-spring changes, and subgroup gaps shown in the “significantly behind grade level” and scale score tables are rounded to one decimal place. We calculated all fall-to-spring changes and subgroup gaps from the exact (unrounded) percentages and mean scale scores. This method ensures that our calculations are as precise as possible but

*means that some may be slightly different than calculations based on the rounded percentages and mean scale scores shown in the tables. Source: Student demographic data were obtained from the MSDS. M-STEP data were provided to EPIC by MDE. School districts submitted benchmark assessment data directly to MDH, and these data were provided to EPIC through a collaboration between EPIC, MEDC, and MDE.*

Notes: The “Score Gap” panel shows the differences between the average scale scores for a focal group and for a comparison (or reference) group. We use parentheses to denote gaps in which the reference group has a higher percentage than the focal group. Changes in these gaps reflect the change in the absolute value of the gap (e.g., a positive change indicates that the gap became larger in magnitude from fall to spring, regardless of the direction of the gap). Gaps that reverse in direction from fall to spring are denoted by the letter “R.” All percentages, mean scale scores, fall-to-spring changes, and subgroup gaps shown in the “significantly behind grade level” and scale score tables are rounded to one decimal place. We calculated all fall-to-spring changes and subgroup gaps from the exact (unrounded) percentages and mean scale scores. This method ensures that our calculations are as precise as possible but means that some may be slightly different than

*calculations based on the rounded percentages and mean scale scores shown in the tables. Source: Student demographic data were obtained from the MSDS. M-STEP data were provided to EPIC by MDE. School districts submitted benchmark assessment data directly to MDH, and these data were provided to EPIC through a collaboration between EPIC, MEDC, and MDE.*

Notes: The "Score Gap" panel shows the differences between the average scale scores for a focal group and for a comparison (or reference) group. We use parentheses to denote gaps in which the reference group has a higher percentage than the focal group. Changes in these gaps reflect the change in the absolute value of the gap (e.g., a positive change indicates that the gap became larger in magnitude from fall to spring, regardless of the direction of the gap). Gaps that reverse in direction from fall to spring are denoted by the letter "R." All percentages, mean scale scores, fall-to-spring changes, and subgroup gaps shown in the "significantly behind grade level" and scale score tables are rounded to one decimal place. We calculated all fall-to-spring changes and subgroup gaps from the exact (unrounded) percentages and mean scale scores. This method ensures that our calculations are as precise as possible but means that some may be slightly different than

*calculations based on the rounded percentages and mean scale scores shown in the tables. Source: Student demographic data were obtained from the MSDS. M-STEP data were provided to EPIC by MDE. School districts submitted benchmark assessment data directly to MDH, and these data were provided to EPIC through a collaboration between EPIC, MEDC, and MDE.*

## COMPARING STUDENT TRAJECTORIES ON M-STEP BEFORE AND DURING THE PANDEMIC

Since Michigan resumed M-STEP testing in spring 2021, we are now able to compare student achievement trends on the state's summative assessment before and during the COVID-19 pandemic. The following analysis compares movement between M-STEP proficiency levels for two cohorts of Michigan students: a "pre-pandemic cohort" that completed either the mathematics or ELA M-STEP assessment in two time periods before the school closures that occurred at the start of the pandemic (i.e., spring 2017 and spring 2019) and a "pandemic" cohort that completed one iteration of the M-STEP before the pandemic and the first administration of the assessment since the pandemic (i.e., spring 2019 and spring 2021)

We calculate the distribution of students across M-STEP proficiency levels for those students in the pre-pandemic cohort who completed either the M-STEP Mathematics or ELA assessment in both 2017 and 2019 (e.g., students who completed the 3<sup>rd</sup>-grade M-STEP Mathematics in 2017 and the 5<sup>th</sup>-grade M-STEP Mathematics in 2019). We repeat this calculation for the pandemic cohort of students who completed M-STEP assessments for the same grade-levels and subject in 2019 and 2021 (e.g., students who completed the 3<sup>rd</sup>-grade M-STEP Mathematics in 2019 and 5<sup>th</sup>-grade M-STEP Mathematics in 2021). By comparing the distribution of proficiency levels for each administration both within and across cohorts, we can see how achievement trends differ across students who completed both assessments before the pandemic and those who were affected by the pandemic over the past two school years. This analysis is repeated for students who initially completed 3<sup>rd</sup>-, 4<sup>th</sup>-, or 5<sup>th</sup>-grade M-STEP assessments in 2017 (or 2019). We also provide breakdowns for each of the student subgroups examined in the main analysis. In the main text that follows, we only show results for the overall population of Michigan students and breakdowns by race/ethnicity. Patterns for other subgroups are similar, and follow the expected trajectories given the results discussed above in relation to benchmark assessment data. The remaining subgroup analyses can be found in Appendix Tables A.29–A.34.

These M-STEP analyses are based on imperfect and incomplete data. Although nearly all (N=825) Michigan districts participated in M-STEP testing in spring 2021, participation rates within those districts were much lower than in a typical year, and

the students who are represented in the analysis do not perfectly reflect the population of Michigan students overall or, in many cases, within a given district. Moreover, participation rates varied greatly across different types of districts; districts with greater 2021 M-STEP participation rates were more likely to offer in-person instruction throughout the 2020-21 school year. These differences are particularly important to keep in mind when comparing achievement across students in the pre-pandemic and pandemic cohorts.

Table 3.8.1 through Table 3.8.8 provide the overall and subgroup-specific comparisons of students in the pre-pandemic and pandemic cohorts. Each row of the table represents a group of students in the same cohort who achieved the same proficiency level on the M-STEP in the first time period (i.e., 2017 for the pre-pandemic cohort and 2019 for the pandemic cohort). The percentages in each row show the shares of these students that achieved each possible proficiency level two years later (i.e., 2019 for the pre-pandemic cohort and 2021 for the pandemic cohort). Each cell is shaded according to these percentages, where darker shades of green correspond to higher percentages (i.e., the background of a cell that represents 100% of students would be the darkest shade of green, while the background of a cell that represents 0% of students would be white). If students were equally likely to score within any one of the four proficiency levels in the second time period, regardless of their prior proficiency level, each cell would be the same light shade of green (representing 25% of students in each of the four cells in each row).

There are several important takeaways from the combined set of tables. First, across all student characteristics (race/ethnicity, gender, economic disadvantage, and special education) and grade levels (3<sup>rd</sup>, 4<sup>th</sup>, and 5<sup>th</sup> in the base year), it was far less likely for students to move from lower to higher M-STEP proficiency levels between test administrations during the pandemic relative to prior to the pandemic. Second, and relatedly, it was far more likely for students during the pandemic than before the pandemic to move from higher to lower M-STEP proficiency levels across years.

This can easily be seen in Table 3.8.1 for the overall population of students who took the M-STEPS. For example, as seen in the top panel of the table, 83% of students in the pre-pandemic cohort who scored “Not Proficient” on the 3<sup>rd</sup>-grade M-STEP Mathematics assessment in 2017 scored “Not Proficient” again on the 5<sup>th</sup>-grade assessment in 2019. The remaining 16% and 2% who scored “Not Proficient” in 2017 scored “Partially Proficient” and “Proficient” in 2019, respectively. However, for the pandemic cohort, 91% of students who scored “Not Proficient” on the 3<sup>rd</sup>-grade M-STEP Mathematics assessment in 2019 scored “Not Proficient” again in 2021, an increase of eight percentage points between cohorts. Conversely, at the top of the distribution, 65% of students in the pre-pandemic cohort who scored “Advanced” on the 3<sup>rd</sup>-grade M-STEP Mathematics assessment in 2017 scored “Advanced” again in

2019, while 26% scored "Proficient," 8% scored "Partially Proficient," and 1% scored "Not Proficient." For the pandemic cohort, only 49% of students who scored "Advanced" on the 3<sup>rd</sup>-grade M-STEP Mathematics assessment 2019 scored "Advanced" again in 2021, while 31% scored "Proficient," 17% scored "Partially Proficient," and 3% scored "Not Proficient."

Table 3.8.3 through Table 3.8.8 provides the same analyses for racial/ethnic subgroups. The overall trends carry through for all subgroups of students. However, these patterns are more pronounced for some groups than for others. For instance, in Table 3.8.3, 97% of Black students in the pandemic cohort who were "Not Proficient" in mathematics as 3<sup>rd</sup> graders were still "Not Proficient" two years later as 5<sup>th</sup> graders (compared to 90% for the pre-pandemic cohort). Of Black students in the pandemic cohort who were "Advanced" in mathematics as 3<sup>rd</sup> graders in the first time period, only 20% were still "Advanced" as 5<sup>th</sup> graders in the second time period, while 34% were "Proficient," 30% were "Partially Proficient," and 16% were "Not Proficient." In comparison, out of all Black students from the pre-pandemic cohort who were "Advanced" in mathematics as 3<sup>rd</sup> graders, 44% were still "Advanced" two years later as 5<sup>th</sup> graders, 31% were "Proficient," 18% were "Partially Proficient," and 6% were "Not Proficient." These patterns provide suggestive evidence that, while the pandemic school years stifled upward mobility through M-STEP proficiency levels for all students, certain groups of students—in particular Black students—fared worse during the pandemic than did others. Although not shown here, Appendix Tables A.29-A.34 show that economically disadvantaged students were also less likely to stay at or move up in their proficiency level during the pandemic than they were prior to the pandemic, especially relative to their non-economically disadvantaged peers.

Table 3.8.1. Two-Year M-STEP Mathematics Proficiency Level Trajectories between 2017-2019 and 2019-2021					
3 <sup>rd</sup> -Grade Proficiency Level (2017, 2019)	Cohort	5 <sup>th</sup> -Grade Proficiency Level (2019, 2021)

	Pre-Pandemic	4%	27%	48%	21%
Advanced	Pandemic	1%	10%	35%	54%
	Pre-Pandemic	0%	4%	24%	71%

Notes: “Not Proficient,” “Partially Proficient,” “Proficient,” and “Advanced” are the four proficiency levels from Michigan’s summative M-STEP Mathematics and ELA assessments. The proficiency levels in the left-most column represent base-year achievement levels for students in each cohort (i.e., 3<sup>rd</sup>-, 4<sup>th</sup>-, or 5<sup>th</sup>-grade proficiency in 2017 for the pre-pandemic cohort, or 3<sup>rd</sup>-, 4<sup>th</sup>-, or 5<sup>th</sup>-grade proficiency in 2019 for students in the pandemic cohort). Proficiency levels across the top row represents achievement levels two years later for students in each cohort (i.e., 5<sup>th</sup>-, 6<sup>th</sup>-, or 7<sup>th</sup>-grade proficiency in 2019 for students in the pre-pandemic cohort, or 5<sup>th</sup>-, 6<sup>th</sup>-, or 7<sup>th</sup>-grade proficiency for students in the pandemic cohort). The percentages in each row and column combination represent the share of students from a particular cohort and base-year achievement level that scored at a particular proficiency level two years later. For example, in the top-left corner of this table, among pandemic cohort students who scored “Not Proficient” on the 2019 3<sup>rd</sup>-grade M-STEP Mathematics assessment, 91% also scored “Not Proficient” on the 5<sup>th</sup>-grade assessment in 2021.

Table 3.8.2. Two-Year M-STEP ELA Proficiency Level Trajectories between 2017-2019 and 2019-2021					
3 <sup>rd</sup> -Grade Proficiency Level (2017, 2019)	Cohort	5 <sup>th</sup> -Grade Proficiency Level (2019, 2021)			
		Not Proficient	Partially Proficient	Proficient	Advanced
Not Proficient	Pandemic	80%	16%	4%	0%
	Pre-Pandemic	73%	20%	6%	0%
Partially Proficient	Pandemic	40%	37%	21%	2%
	Pre-Pandemic	30%	38%	29%	3%
Proficient	Pandemic	12%	27%	49%	12%
	Pre-Pandemic	8%	22%	54%	16%
Advanced	Pandemic	2%	6%	38%	54%
	Pre-Pandemic	1%	4%	34%	60%
4 <sup>th</sup> -Grade Proficiency Level (2017, 2019)	Cohort	6 <sup>th</sup> -Grade Proficiency Level (2019, 2021)			
		Not Proficient	Partially Proficient	Proficient	Advanced
Not Proficient	Pandemic	76%	21%	3%	0%
	Pre-Pandemic	69%	26%	5%	0%
Partially Proficient	Pandemic	38%	45%	17%	0%
	Pre-Pandemic	26%	46%	26%	1%
Proficient	Pandemic	13%	39%	43%	5%
	Pre-Pandemic	7%	30%	53%	9%
Advanced	Pandemic	2%	12%	48%	38%
	Pre-Pandemic	1%	7%	42%	50%
5 <sup>th</sup> -Grade Proficiency Level (2017, 2019)	Cohort	7 <sup>th</sup> -Grade Proficiency Level (2019, 2021)			
		Not Proficient	Partially Proficient	Proficient	Advanced
Not Proficient	Pandemic	73%	24%	3%	0%
	Pre-Pandemic	74%	23%	3%	0%
Partially Proficient	Pandemic	34%	47%	19%	0%
	Pre-Pandemic	33%	48%	19%	1%
Proficient	Pandemic	9%	33%	52%	6%
	Pre-Pandemic	8%	32%	52%	8%
Advanced	Pandemic	1%	7%	49%	43%
	Pre-Pandemic	1%	6%	44%	49%

Notes: “Not Proficient,” “Partially Proficient,” “Proficient,” and “Advanced” are the four proficiency levels from Michigan’s summative M-STEP Mathematics and ELA assessments. The proficiency levels in the left-most column represent base-year achievement levels for students in each cohort (i.e., 3<sup>rd</sup>-, 4<sup>th</sup>-, or 5<sup>th</sup>-grade proficiency in 2017 for the pre-pandemic cohort, or 3<sup>rd</sup>-, 4<sup>th</sup>-, or 5<sup>th</sup>-grade proficiency in 2019 for students in the pandemic cohort). Proficiency levels across the top row represents achievement levels two years later for students in each cohort (i.e., 5<sup>th</sup>-, 6<sup>th</sup>-, or 7<sup>th</sup>-grade proficiency in 2019 for students in the pre-pandemic cohort, or 5<sup>th</sup>-, 6<sup>th</sup>-, or 7<sup>th</sup>-grade proficiency for students in the pandemic cohort). The percentages in each row and column combination represent the share of students from a particular cohort and base-year achievement level that scored at a particular proficiency level two years later. For example, in the top-left corner of this table, among pandemic cohort students who scored “Not Proficient” on the 2019 3<sup>rd</sup>-grade M-STEP Mathematics assessment, 91% also scored “Not Proficient” on the 5<sup>th</sup>-grade assessment in 2021.

Notes: “Not Proficient,” “Partially Proficient,” “Proficient,” and “Advanced” are the four proficiency levels from Michigan’s summative M-STEP Mathematics and ELA assessments. The proficiency levels in the left-most column represent base-year achievement levels for students in each cohort and racial/ethnic subgroup combination. Proficiency levels across the top row represents achievement levels two years later. The percentages in each row and column combination represent the share of students from a particular cohort, racial/ethnic subgroup, and base-year achievement level that

*scored at a particular proficiency level two years later. For example, in the top-left corner of this table, among 5<sup>th</sup>-grade White pandemic cohort students who scored "Not Proficient" on the 2019 M-STEP ELA assessment, 70% also scored "Not Proficient" on the 6<sup>th</sup>-grade assessment in 2021.*

## REGRESSION ANALYSIS: BENCHMARK & M-STEP ASSESSMENT OUTCOMES

### Benchmark Assessment Regressions

Table 3.9.1 and Table 3.9.2 provide regression output estimating the relationship between the fall and spring percentages of students who scored "significantly behind grade level" (Table 3.9.1), or average scale scores (Table 3.9.2). The purpose of these tables is to show how students from different backgrounds and those who need specialized instruction (e.g., special education and English language learners) performed during the pandemic. Since each observation is a district-grade, we use the percent of students in a district as a proxy for student characteristics. These include gender, race/ethnicity, economically disadvantaged status, special education status, and English learner status. In these models, we include a separate coefficient for the percent of students who are "Two or more races," rather than combine this group with the American Indian or Alaska Native and Native Hawaiian or Pacific Islander groups as part of the "Other" category as we do for the other analyses in this report. We grouped these three categories together for the subgroup-specific analyses because there were too few students to report outcomes in some assessment provider and grade combinations, but the number of students is large enough for us to include a separate category for "Two or more races" in the regression models. We also include a logged measure of total enrollment, indicators for district urbanicity, and an indicator for each grade level. The tables present mathematics (columns 1 through 3) and reading/ELA results (columns 4 through 6) for NWEA MAP Growth, i-Ready, and Star 360 districts. Since very few Michigan districts offered students the Smarter Balanced ICA and K-2 benchmark assessments, we do not include results from these assessments.

The regression coefficients associated with each variable in the model tell us how a particular spring benchmark outcome would change given a one-unit change in fall benchmark outcomes or a particular district characteristic. For example, in Table 3.9.1 column 1, the coefficient on the percent of students in the district who are female in mathematics is 0.176. This number tells us that a 10 percentage point increase in the female student population in a district is associated with an increase of 1.76 percentage point increase in the proportion of students scoring "significantly behind grade level" in mathematics in the spring of 2021. Because the model controls for the

average rate of students scoring “significantly behind grade level” in fall 2021, the estimates can be interpreted as correlations with average achievement growth relative to students in districts with similar characteristics.

As seen in Table 3.9.1, the coefficients on the fall percentage of students scoring “significantly behind grade level” in mathematics or reading are relatively similar for each assessment provider. Specifically, for each percentage point increase in the proportion of NWEA MAP Growth, Curriculum Associates i-Ready, and Renaissance Learning Star 360 students scoring “significantly behind grade level” in mathematics or reading in the fall, we expect, on average, the proportion of students scoring “significantly behind grade level” to increase by between 0.43 and 0.71 percentage points in the same subject and assessment in the spring. Thus, as expected, each of these results indicate that there is a positive correlation between fall and spring benchmark assessment outcomes and those districts that started the year with a high percentage of students scoring “significantly behind grade level” will also have a high percentage in the spring.

Turning to district characteristics, the signs on the estimated relationship between spring percentages of students who scored “significantly behind grade level” and each district characteristic for the most part confirm the results discussed earlier in this report. For example, the percentage of Black and Latino/a/x students in a district are positively correlated with the percentage of students scoring “significantly behind grade level” on the spring benchmark assessments in both mathematics and reading while the share of Asian students is negatively correlated. Since the percent of White students is the reference category, these estimates are relative to a similar change in percent of students in a district who are White. For example, looking at column 1 where we show NWEA MAP Growth in mathematics, the estimates show that a district with 10 percentage points more Black students has a 1.57 percentage point higher proportion of students scoring “significantly below grade level,” while for Latino/a/x, that rate is 0.68 percentage points higher relative to a similar increase in the percent of White students. A 10 percentage point increase in Asian student enrollment is correlated with a 0.8 percentage point lower rate of students scoring “significantly below grade level” on the NWEA MAP assessment relative to a similar increase in White enrollment rates. Estimates for reading are broadly similar.

Economically disadvantaged and special education status also are both positively correlated with spring percentages of students scoring “significantly behind grade level” in mathematics and reading, and these relationships are typically larger in magnitude than the relationships between the proportions of students of different races/ethnicities and spring outcomes. English learner status is negatively correlated with the percentages of students scoring “significantly behind grade level” in

mathematics and reading for some districts (i.e., Curriculum Associates i-Ready for mathematics and NWEA MAP Growth for reading) and positively correlated with outcomes for Renaissance Learning Star 360 districts. This is likely due to differences in the student populations that took the test in the districts that offered different assessments.

The estimates on total enrollment and each urbanicity indicator likely reflect differences in other unobserved student characteristics not included in the model and the types of instructional modality offered in the different districts throughout the school year. For example, large, urban districts were considerably more likely to offer only remote instruction throughout the school year than were smaller or rural school districts (see Hopkins et al., 2021). Also, the literature discussed in our August report shows a growing body of research describing the negative relationship between academic outcomes and remote instruction over the last year and a half. We explore this relationship using benchmark and M-STEP assessment data later in this report.

Table 3.9.2 provides estimates of the relationship between fall and spring average scale scores on mathematics and reading benchmark assessments while controlling for the same district-level characteristics found in Table 3.9.1. The structure for this table is similar to that in Table 3.9.1. The outcome variable is average scale scores for each specific assessment provider and subject combination. Hence, for example, we can interpret the coefficient on the proportion of female students in a district in column (1) as follows: a 10 percentage point increase in the share of female students is associated with a (statistically insignificant) decrease in NWEA MAP Growth scores of 0.2 scale score points.

As seen in the first row of the table, across both subjects and all three assessment providers, fall and spring average scale scores are positively correlated, and we would expect districts that started the year with higher average scale scores in the fall to also have higher scores in the spring compared to districts with worse outcomes to start the school year. Notably, the estimates in column 6 show that the relationship between fall and spring average reading scale scores among students in Renaissance Learning Star 360 districts is not only positively correlated, but greater than one. This means that a one-scale score unit increase in fall average reading scores is associated with a 1.025 point increase in spring average reading scale scores.

Before discussing the relationships between student characteristics and benchmark scores for this model, it is important to understand the connection between movement in the percentage of students scoring “significantly behind grade level” and changes in average scale scores. Specifically, given the relationships provided in Table 3.9.1, any increase in the proportion of students scoring “significantly below grade level” on a specific benchmark assessment implies that assessment scale scores for at

least some students in that population are also decreasing. Thus, any *increase* in the proportion of students scoring “significantly below grade level” on a given benchmark assessment is likely to be accompanied by a *decrease* in average scale scores for the same population of students, and specific regression coefficients in Table 3.9.1 and Table 3.9.2 should be opposite signed.

This is exactly what we see for most of the characteristics in Table 3.9.2. Consistent with the results in Table 3.9.1, the percentage of Black students in a district is negatively correlated with average scale scores in both mathematics and reading while the share of Asian students is positively correlated. Similarly, the proportions of economically disadvantaged and special education students are both negatively correlated with spring average scale scores in mathematics and reading, and again, the relationship for special education is typically larger in magnitude than relationships between the racial/ethnic composition of districts and the same outcomes. Finally, smaller and more rural districts also saw higher average scale scores in spring 2021. Specifically, the estimated relationship between total enrollment and average scale scores in both mathematics and reading was typically negative, and the relationships for “rural” and “town” districts were positive.

Table 3.9.3 extend the models seen in the previous two tables to consider instructional modality. Using monthly data on school modality MDE collected, we calculate the number of months each modality—in-person, hybrid, or remote—was *offered* by the district during the 2020-21 school year. Hence, a district can have months where it offers multiple modalities to the students. We created three variables—*months in-person*, *months hybrid*, and *months remote*—which describe the total number of months a district offered a particular type of modality during the 2020-21 school year (maximum of 9). The coefficients on these variables describe the relationship between students receiving an additional month of hybrid or remote instruction instead of in-person instruction on benchmark mathematics and reading outcomes. Notably, this does not necessarily reflect actual take-up of given modalities by students, though presumably offering a specific modality will increase take-up (for more on this, see the [monthly EPIC reports on this topic](#)). Since the estimates for the district characteristics are similar to estimates in the previous two tables, we focus on the modality estimates here. Further, since there was little variation in the modality of districts that used Curriculum Associates i-Ready or Renaissance Learning Star 360 assessments, estimates for those benchmark exams were very imprecise. Hence, we only provide the MAP Growth estimates here.

The first panel of Table 3.9.3 shows these results from regression using as the outcome the proportion of students who score “significantly below grade level” in mathematics (column 1) and reading (column 2). Columns 3 and 4 show the same

results for average scale scores. For mathematics, the *months remote* variable is statistically significant and indicates that a district offering an additional month of remote schooling has a 0.9 percentage point higher rate of students scoring “significantly below grade level.” Similarly, for reading, an additional month of in-person instruction is associated with a 0.5 percentage point lower rate of students scoring “significantly below grade level”. It is important to reiterate, however, that districts with characteristics that correlate with low achievement tended to be less likely to offer in-person schooling and so these estimates do not necessarily reflect causal effects of instructional modality. Columns 3 and 4 show similar patterns. An additional month of remote schooling is associated with 0.42 and 0.27 points lower scale scores for mathematics and reading, respectively. The estimates for in-person months are positive but not statistically significant.

## M-STEP Assessment Regressions

Table 3.10.1 through Table 3.10.6 provide regression output estimating differences in learning trajectories between our pre-pandemic and pandemic M-STEP cohorts (Table 3.10.1), as well as differences across student groups in the pandemic cohort (Table 3.10.6). As a reminder, the pre-pandemic cohort completed either the M-STEP Mathematics or ELA assessment in two time periods before the start of the pandemic (i.e., spring 2017 and spring 2019), and the pandemic cohort completed one iteration of the M-STEP before the pandemic and the first administration of the assessment since the pandemic (i.e., spring 2019 and spring 2021).

The use of the M-STEP has both advantages and disadvantages relative to the benchmark assessments. In terms of advantages, the M-STEP data is recorded at the individual student level both before and after the start of the COVID-19 pandemic. This gives us the ability to control for additional factors as well as many of the characteristics included in the benchmark analysis for individual students, rather than district-grade averages. Hence, while the resulting estimates are still correlational, they bring us closer to what is likely to be the actual effect of the pandemic and modality on students than do the district-grade aggregate benchmark exams. However, since M-STEPS were not administered in 2020, we must use two-year periods to measure achievement growth, and thus the pandemic cohort includes some instruction in 2019 before the start of the pandemic. Moreover, many students did not take the M-STEP in 2021 and this was particularly the case for students enrolled in districts that offered remote schooling. As such, there are likely important differences in the types of students who took the exam in 2021 relative to earlier years and these differences may affect the accuracy of the regression-based estimates.

The variables included in these models are slightly different than those included in the benchmark regression analyses discussed above. First, M-STEP Mathematics and ELA scores have been standardized within each cohort to enable a comparison of student achievement over time. Specifically, we calculate the mean and standard deviation of M-STEP Mathematics and ELA scores separately for each grade level in the base year for each cohort (i.e., 2017 and 2019 for the pre-pandemic and pandemic cohorts, respectively), then use these grade- and year-specific means to standardize M-STEP Mathematics and ELA scores for the same grade levels relative to the base year for each cohort (e.g., for the pre-pandemic cohort, in both 2017 and 2019, we subtract the 2017 3<sup>rd</sup>-grade mathematics mean from each observation and divide by the 2017 3<sup>rd</sup>-grade mathematics standard deviation). The other controls included in the regression models are created using student-level data, hence, each variable is a binary indicator

that describes a student's gender, race/ethnicity, and eligibility for certain school resources (i.e., economically disadvantaged, special education, English learner, homeless, and migrant status).

The structure of these variables also requires different interpretations of regression coefficients. The most important variable in the following regressions is the binary indicator, *pandemic cohort*, which identifies students who completed M-STEP assessments in 2019 and 2021. The coefficient on this variable summarizes the differences in academic growth for a given subject between the pre-pandemic and pandemic cohorts. For example, as seen in Table 3.10.1 column 1, the coefficient on *pandemic cohort* is -0.218 and should be interpreted as follows: average M-STEP Mathematics score growth among students in the pandemic cohort was -0.218 standard deviations less than M-STEP Mathematics score growth among students in the pre-pandemic cohort. Other than the base year variable, which controls for academic achievement in the base year for each cohort, all other variables in each model are binary indicators and their coefficients help summarize achievement gaps within a specific demographic characteristic, regardless of the student's inclusion in the pre-pandemic or pandemic cohort. Again, looking to Table 3.10.1 column 1, the coefficient on *female* shows that, on average across both cohorts, female students scored 0.010 standard deviations below their male counterparts on the M-STEP Mathematics assessments.

For Table 3.10.1, we provide estimates from two different model specifications for each subject. The first column in each panel (columns 1 and 3), estimates the differences in learning trajectories between our pre-pandemic and pandemic M-STEP cohorts while controlling for differences across student demographic characteristics (i.e., gender, race/ethnicity, and eligibility for school resources) and grade levels. The second column in each panel also includes district fixed effects which control for potentially unobservable differences across district that do not change over time and may affect student achievement (e.g., resources, administrator quality, etc.). Given the similarities in the coefficient estimates across models, we only discuss estimates for the district fixed-effect models for each subject (columns 2 and 4).

Regardless of the specification, we find that mathematics and reading achievement among students in the pandemic cohort consistently lagged that of students in the pre-pandemic cohort (Table 3.10.1). Specifically, mathematics growth among students in the pandemic cohort was roughly two-tenths of a standard deviations behind students in the pre-pandemic cohort, while ELA growth trailed by a bit less than a tenth of a standard deviation. While not large, these effect sizes are quite substantial and suggest that Michigan students made slower gains during the pandemic than in the years prior. The larger disparity in mathematics is expected given the large literature

documenting the benefits of school-based interventions on mathematics achievement compared to reading outcomes, and the pandemic certainly limited opportunities for instruction among students in the pandemic cohort for at least a portion of the 2019-2020 and 2020-21 academic years.

Coefficients on each student demographic characteristics also show clear gaps in achievement between student subgroups that are broadly similar to those we see in the benchmark assessments. First, mathematics scores for female students lagged their male counterparts by a tenth of a standard deviation, however, ELA scores for female students were 0.06 standard deviations higher than for male students. We also find clear differences by race/ethnicity. Except for Asian students, mathematics and ELA achievement for all non-White subgroups trailed White achievement. The gaps between Black and White students in both subjects were particularly large, at -0.14 and -0.10 standard deviations in mathematics and ELA, respectively. Finally, mathematics and ELA achievement among most students eligible for additional school resources (i.e., economically disadvantaged, special education, English learner, and homeless students) trailed that of students who did not qualify for additional services or supports.

In Table 3.10.2 through Table 3.10.6, we extend the models estimated in Table 3.10.1 to examine how achievement differences by student demographic characteristics changed from the pre-pandemic to the pandemic cohort. These results provide some insight into whether students with different characteristics or backgrounds fared better or worse during the pandemic, though we note that these differences may not be caused by the pandemic and could be due to other factors such as differences in who opted into testing. For this analysis, we multiply the pandemic cohort indicator by one or more of the student demographic characteristic indicators and include all these new interactions in the regression models. Including these new interaction terms again changes the interpretation of specific coefficients in each model. For example, Table 3.10.2 column 1, includes a new interaction term between *pandemic cohort* and *female*. In this specification, the coefficient on *pandemic cohort* represents the change in mathematics growth for male pandemic cohort students relative to pre-pandemic male students. The coefficient on *female\*pandemic cohort* represents any additional changes in achievement for pandemic cohort female students relative to pre-pandemic female students. Although not shown here, each specification in Table 3.10.2 through Table 3.10.6 continues to include the full set of student demographic indicators shown in Table 3.10.1.

Table 3.10.2 shows that both mathematics and ELA achievement for male and female students in the pandemic cohort lagged achievement among students in the pre-pandemic cohort. Specifically, mathematics growth among male students in the

pandemic cohort was 0.21 standard deviations behind students in the pre-pandemic cohort. For female students, the reduction in growth during the pandemic cohort was 0.03 standard deviations larger, leading to a 0.24 standard deviation lower growth rate (where  $0.24 = 0.21 + 0.03$ ). We find a similar relationship in ELA, where ELA growth for male students in the pandemic cohort dropped by 0.075 standard deviations relative to the pre-pandemic cohort while the decrease for female students was a slightly larger 0.087 standard deviations ( $0.087 = 0.075 + 0.012$ ).

Table 3.10.3 provides results from models estimating racial/ethnic differences in mathematics and ELA growth for pandemic cohort students. For mathematics, White students in the pandemic cohort experienced 0.213 standard deviations less growth relative to students in the pre-pandemic cohort. Black student achievement grew at a lower rate (-0.054 standard deviations) as did Asian students (-0.044 standard deviations). Latino/a/x student achievement growth reductions were not statistically significantly different from White student growth while American Indian or Alaskan Native and Native Hawaiian or Pacific Islander students in the pandemic cohort were the only subgroup that grew at a faster rate than White students (0.048 standard deviations), though this estimate is only marginally significant. For ELA, we find no statistically significant differences in M-STEP ELA growth across racial/ethnic subgroups in the pandemic cohort relative to the pre-pandemic cohort.

Models in Table 3.10.4 and Table 3.10.5 show differences by economically disadvantaged and special education status, respectively. In both mathematics and ELA, economically disadvantaged students saw slower achievement growth than did advantaged students. While special education students experienced reductions in achievement growth throughout the pandemic relative to pre-pandemic, these were not as large as the reductions for general education students. It is unclear why this is the case, but it may have to do with more special education students being given in-person options and differences in who opted out of testing between special education and general education students.

Finally, Table 3.10.6 provides output from models estimating differences in mathematics and ELA growth by instruction modality for pandemic cohort students. For each of these models, the coefficient estimates on *pandemic cohort* on its own is not meaningful as it indicates pandemic achievement growth for schools that offered zero months of any modality. This did not occur in practice as every district offered instruction in at least one modality in each month. Coefficients on the hybrid and remote instruction interaction terms, *months in-person\*pandemic cohort*, *months hybrid\*pandemic cohort*, and *months remote\*pandemic cohort*, describe how mathematics and ELA outcomes varied when students in the pandemic cohort were offered an additional month instruction in the given modality. As seen in columns 2

and 4, mathematics and ELA growth for pandemic cohort students who attended school in districts offering in-person instruction for the entire 2020-21 school year were 0.166 ( $0.154 + 0.001*9$ ) and 0.051 ( $0.036 + 0.002*9$ ) standard deviations behind growth for students in the pre-pandemic cohort. Note that the estimate for reading, while negative, is not statistically significantly different from zero.

If instead a district offered only hybrid instruction throughout the entire year, math achievement growth was 0.271 standard deviations lower than the pre-pandemic cohort while reading growth was 0.108 standard deviations lower. Finally, districts that offered only remote instruction throughout the 2020-21 school year saw a reduction in mathematics growth of 0.361 standard deviations, about twice the drop for entirely in-person districts. For reading, entirely remote districts saw ELA growth fall by 0.144 standard deviations during the pandemic.

Notes: Although not shown, all models include controls for gender and race/ethnicity, as well as economically disadvantaged, special education, English learner, homeless, and migrant status. Each model also includes grade-level indicators for each sub-cohort to control for differences in learning trajectories between younger and older students. Columns 2 and 4 include binary indicators for each district to control for time-invariant, unobservable characteristics of each district that may influence learning trajectories. Each modality variable counts the total number of months during the 2020-21 school year where a school district offered a particular instructional modality to students. Instructional modality data was collected through individual district responses to MDE’s Reconfirmed COVID-19 Learning Plan Monthly Questionnaires between September 2020 and May 2021. In these surveys, districts were asked to describe the specific instruction modalities—in-person, hybrid, remote, or some combination of the three—they planned to offer students each month. Robust standard errors, clustered at the district level, are in parentheses. +  $p < 0.10$ , \*  $p < 0.05$ , \*\*  $p < 0.01$ , \*\*\*  $p < 0.001$

## SUMMARY

Overall, we find that all types of students made less than normal progress toward learning goals in 2020-21. However, not all student groups were affected equally. Our results suggest that disruptions to the 2020-21 school year may have exacerbated many pre-existing achievement gaps. In particular, Black, Latino/a/x, economically disadvantaged, and special education students were more likely to be “significantly behind grade level” than their peers at both the beginning and end of the year, and these gaps typically grew larger in magnitude over the course of the year.

We also find that students whose districts offered fully in-person instruction all year typically fared better than students in districts that were either remote all year or switched between remote and hybrid modalities. In districts that switched between in-person and hybrid or remote instruction, on average, students started the year with higher average scores than those in districts that were in-person all year, however, these gaps diminished and, in some cases, even reversed over the course of the year. Results for districts that provided hybrid instruction all year were less consistent; this may point to the fact that districts structured their hybrid programs in vastly different ways, some of which were likely more effective than others.

Our analyses of 2021 M-STEP results affirm that student learning during the pandemic school years ending in spring 2021 occurred at a slower rate than before the pandemic. Compared to similar students who took the M-STEP in 2017 and 2019, students who took these assessments in 2019 and 2021 were less likely to maintain or advance to a higher proficiency level over a two-year period, particularly in math. Regression analyses confirm that student achievement in both math and ELA grew less during than before the pandemic, and this was especially the case for economically disadvantaged and Black students and students learning in districts that offered remote instruction for more of the year.

However, we stress that far fewer students participated in the M-STEP in 2021 than in previous years, and that there are qualitative differences between the pre-pandemic and pandemic cohorts as a result, as well as qualitative differences between students who were and were not tested in 2021. Similarly, not all districts administered one of the MDE-approved benchmark assessments included in our analyses, nor did all students within participating districts take both the fall and spring tests. Although neither assessment data source is complete or perfectly representative of the state, the M-STEP analyses are more representative of all districts in the state than are the benchmark assessment analyses, and the benchmark assessment analyses are more representative of the student population.

# Section Four:

## Future Research

This report helps to deepen our understanding of how Michigan public school students progressed and learned during the 2020-21 school year. In particular, we are able to expand on the basic descriptive analyses from our initial report by examining differences in performance across subgroups of students and incorporating new data sources and analysis methods to gain insight beyond the districts and students that submitted fall and spring benchmark assessment data to MDH. However, this new analysis is still limited by the number of districts submitting benchmark data and limited participation in the 2021 end-of-year summative M-STEP assessments. Moreover, the benchmark testing data only encompass one school year while the pandemic will undoubtedly have longer lasting effects on student achievement. To augment the work presented here and provide greater insights into student progress during the pandemic, EPIC—in partnership with MDE, CEPI, and MEDC—will release a series of additional reports over the next several years.

Our next full report, which will be released in spring 2022, will analyze benchmark assessment data collected during the fall 2021 semester and examine fall-to-fall changes in academic outcomes. After that, EPIC will release a report that will analyze the remaining benchmark data collected during the 2021-22 school year, summarizing trends in academic performance over two full school years (i.e., from the 2020-21 and 2021-22 school years). Additionally, to provide insight into how school districts promoted student learning amidst the pandemic, EPIC is engaging in a qualitative inquiry focused on six “best practice districts” that exhibited the largest increases, or in some cases the smallest decreases, in learning outcomes across the 2020-2021 school year for all Michigan students as well as various student subgroups. Districts will be selected within the instructional modalities offered during the 2020-21 school year (i.e., remote, hybrid, and in-person) and include some variation in school governance model (i.e., traditional public schools and charter schools). We will conduct a second set of case studies of districts that appear to be innovating during the 2021-22 school year, as well. Within each case, we will conduct interviews with district, school, and classroom leaders to explore their priorities for responding to the pandemic, strategies used to promote students' access to learning opportunities and

any challenges to implementation. Interviews will also include state-level policymakers and stakeholders to provide context for district-level findings. Findings will highlight promising strategies that may inform equitable approaches to supporting student learning in future years and build resilient school systems.

## REPORT NOTES

---

<sup>1</sup> Fall and spring benchmark assessment administration windows varied from district to district, and individual students within the same district often took these assessments on different days. Thus, students in the same district may be included in different modality subgroups if they were tested in different months, and their districts changed their instructional modality offerings between those two months.

<sup>2</sup> Notes for Table 2.3.1: Due to the low number of students identified as American Indian or Alaskan Native and Native Hawaiian or Pacific Islander, we combined these groups with students identified as two or more races, to create a single “Other” category. The “Enrolled” columns represent the total number of students from a specific racial/ethnic subgroup and grade level enrolled in districts that offered a particular benchmark assessment. The “% Tested” columns represent the percentage of students from each subgroup-grade-assessment provider combination with valid reading/ELA benchmark assessment scores and included in the reading/ELA analytic sample. Student demographic data were obtained from the MSDS. Enrollment data is from the Center for Educational Performance and Information, Student Count Report.

<sup>3</sup> See the MDE’s “Spring 2021 Spring Summative Assessments: Frequently Asked Questions (FAQs)” memo here:

[https://www.michigan.gov/documents/mde/Spring\\_2021\\_Summative\\_Assessments\\_FAQ\\_721789\\_7.pdf](https://www.michigan.gov/documents/mde/Spring_2021_Summative_Assessments_FAQ_721789_7.pdf)

<sup>4</sup> Notes for Tables 3.1.1 through 3.1.6: All percentages, mean scale scores, fall-to-spring changes, and subgroup gaps shown in the “significantly behind grade level” and scale score tables are rounded to one decimal place. We calculated all fall-to-spring changes and subgroup gaps from the exact (unrounded) percentages and mean scale scores. This method ensures that our calculations are as precise as possible but means that some may be slightly different than calculations based on the rounded percentages and mean scale scores shown in the tables. The “Percentage Point Gap” panel shows the differences between the shares of students who are “significantly behind grade level” for a focal group and for a comparison (or reference) group. We use parentheses to denote gaps in which the reference group has a higher percentage than the focal group. Changes in these gaps reflect the change in the absolute value of the gap (e.g., a positive change indicates that the gap became larger in magnitude from fall to spring, regardless of the direction of the gap). Gaps that reverse in direction from fall to spring are denoted by the letter “R.” Student demographic data were obtained from the MSDS. School districts submitted benchmark assessment data directly to MDH, and these data were provided to EPIC through a collaboration between EPIC, MEDC, and MDE.

---

<sup>5</sup> Notes for Tables 3.1.7 through 3.1.12: All percentages, mean scale scores, fall-to-spring changes, and subgroup gaps shown in the “significantly behind grade level” and scale score tables are rounded to one decimal place. We calculated all fall-to-spring changes and subgroup gaps from the exact (unrounded) percentages and mean scale scores. This method ensures that our calculations are as precise as possible but means that some may be slightly different than calculations based on the rounded percentages and mean scale scores shown in the tables. The “Score Gap” panel shows the differences between the average scale scores for a focal group and for a comparison (or reference) group. We use parentheses to denote gaps in which the reference group has a higher percentage than the focal group. Changes in these gaps reflect the change in the absolute value of the gap (e.g., a positive change indicates that the gap became larger in magnitude from fall to spring, regardless of the direction of the gap). Gaps that reverse in direction from fall to spring are denoted by the letter “R.” Student demographic data were obtained from the MSDS. School districts submitted benchmark assessment data directly to MDH, and these data were provided to EPIC through a collaboration between EPIC, MEDC, and MDE.

<sup>6</sup> Notes for Tables 3.5.1 through 3.5.8: The “Percentage Point Gap” panel shows the differences between the shares of students who are “significantly behind grade level” for a focal group and for a comparison (or reference) group. Similarly, The “Score Gap” panel shows the differences between the average scale scores for a focal group and for a comparison (or reference) group. We use parentheses to denote gaps in which the reference group has a higher percentage than the focal group. We use parentheses to denote gaps in which the reference group has a higher percentage than the focal group. Changes in these gaps reflect the change in the absolute value of the gap (e.g., a positive change indicates that the gap became larger in magnitude from fall to spring, regardless of the direction of the gap). Gaps that reverse in direction from fall to spring are denoted by the letter “R.” All percentages, mean scale scores, fall-to-spring changes, and subgroup gaps shown in the “significantly behind grade level” and scale score tables are rounded to one decimal place. We calculated all fall-to-spring changes and subgroup gaps from the exact (unrounded) percentages and mean scale scores. This method ensures that our calculations are as precise as possible but means that some may be slightly different than calculations based on the rounded percentages and mean scale scores shown in the tables. Source: Student demographic data were obtained from the MSDS. School districts submitted benchmark assessment data directly to MDH, and these data were provided to EPIC through a collaboration between EPIC, MEDC, and MDE.

<sup>7</sup> Notes for Table 3.9.3: “Other race” includes students identified as American Indian, Alaskan Native, Native Hawaiian, or Pacific Islander. Both the fall and spring percentages of students scoring “significantly below grade level,” as well as each district-level student demographic percentage, are measured from 0 to 100. Aggregate

student enrollment data are from the 2020-21 MI School Data Student Headcount report. District-level data are linked with publicly available characteristics from the EEM database to estimate the relationship between urbanicity and benchmark outcomes. Each model also includes grade-level indicators for each assessment grade level to control for differences in learning between younger and older students. Each modality variable counts the total number of months during the 2020-21 school year where a school district offered a particular instructional modality to students. Instructional modality data was collected through individual district responses to MDE's Reconfirmed COVID-19 Learning Plan Monthly Questionnaires between September 2020 and May 2021. In these surveys, districts were asked to describe the specific instruction modalities—in-person, hybrid, remote, or some combination of the three—they planned to offer students each month. Robust standard errors, clustered at the district level, are listed in parentheses.
